## PROGRAMMABLE CONTROLLER <br> FPO <br> User's Manual

## Safety Precautions

Observe the following notices to ensure personal safety or to prevent accidents.
To ensure that you use this product correctly, read this User's Manual thoroughly before use.
Make sure that you fully understand the product and information on safety.
This manual uses two safety flags to indicate different levels of danger.

## WARNING

## If critical situations that could lead to user's death or serious injury is assumed by mishandling of the product.

-Always take precautions to ensure the overall safety of your system, so that the whole system remains safe in the event of failure of this product or other external factor.
-Do not use this product in areas with inflammable gas. It could lead to an explosion.
-Exposing this product to excessive heat or open flames could cause damage to the lithium battery or other electronic parts.
-Battery may explode if mistreated. Do not recharge, disassemble or dispose of fire.

## CAUTION

## If critical situations that could lead to user's injury or only property damage is assumed by mishandling of the product.

-To prevent excessive exothermic heat or smoke generation, use this product at the values less than the maximum of the characteristics and performance that are assured in these specifications.
-Do not dismantle or remodel the product. It could cause excessive exothermic heat or smoke generation.
-Do not touch the terminal while turning on electricity. It could lead to an electric shock.
-Use the external devices to function the emergency stop and interlock circuit.
-Connect the wires or connectors securely.
The loose connection could cause excessive exothermic heat or smoke generation.
-Do not allow foreign matters such as liquid, flammable materials, metals to go into the inside of the product. It could cause excessive exothermic heat or smoke generation.
-Do not undertake construction (such as connection and disconnection) while the power supply is on. It could lead to an electric shock.

Design and performance of its products, therefore, we reserve the right to change the manual/ product without notice.

## Introduction

This manual explains hardware configurations, installation, wiring procedures, I/O allocations and maintenance.

## Before You Start

Operating environment
(Use the unit within the range of the general specifications when installing)

- Ambient temperatures:0 to $+55^{\circ} \mathrm{C}$
- Ambient humidity: 30\% to $\mathbf{8 5 \%}$ RH (at $\mathbf{2 5}{ }^{\circ} \mathrm{C}$, non-condensing)
- For use in pollution Degree 2 environment.
- Do not use it in the following environments.
- Direct sunlight
- Sudden temperature changes causing condensation.
- Inflammable or corrosive gas.
- E-xcessive airborne dust, metal particles or saline matter.
- Benzine, paint thinner, alcohol or other organic solvents or strong alkaline solutions such as mmonia or caustic soda.
- Direct vibration, shock or direct drop of water.
- Influence from power transmission lines, high voltage equipment, power cables, power equipment, radio transmitters, or any other equipment that would generate high switching surges. (Min.100mm or less)
Static electricity
- Before touching the unit, always touch a grounded piece of metal in order to discharge static electricity.
- In dry locations, excessive static electricity can cause problems.

Wiring the Power Supply to the Control Unit

- Use a power supply wire that is thicker than 2 mm2 (AWG14), and twist it.
- The unit has sufficient noise immunity against the noise generated on the power line. However, it is recommended to take measures for reducing noise such as using a isolating transformer before supplying the power.
- Allocate an independent wiring for each power supplying line, input/output device and operating device.
- If using a power supply without a protective circuit, power should be supplied through a protective element such as a fuse.
- Be sure to supply power to a control and an expansion units from a single power supply. Turning on/off of the power of all the units must be conducted simultaneously.

Power supply sequence

- In order to protect the power supply sequence, make sure to turn off the control unit before the input/output power supply. If the input/output power supply is turned off before the control unit, or if the control unit is not shut off momentarily, the controller detects change of input level, and might conduct an unexpected operation.
Before turning ON the power
When turning ON the power for the first time, be sure to take the precautions given below.
- When carrying out construction, check to make sure that there are no scraps of wiring, particularly conductive fragments, adhering to the unit.
- Verify that the power supply wiring, I/O wiring, and power supply voltage are all correct.
- Sufficiently tighten the installation screws and terminal screws.
- Set the mode switch to PROG. mode.

## Manuals To Be Used

The required manuals differ according to the units to be used. See the table below.
A: Available N/A: Not available

| Unit type | User's manual <br> No.ARCT1F389E | Programming manual <br> No.ARCT1F313E | Manual No. |
| :--- | :--- | :--- | :--- |
| FP0 Control unit | A | A | N/A |
| FP0 Expansion unit | A | A | N/A |
| FP0 Thermocouple unit | A | A | ARCT1F366E |
| FP0 Analog I/O unit | A | A | ARCT1F390E |
| FP0 A/D conversion unit | A | A | ARCT1F321E |
| FPO D/A conversion unit | A | A | ARCT1F382E |
| FPO CC-Link slave unit | A | A | ARCT1F380E |
| FPO I/O link unit | A | A | N/A |
| FPO Power supply unit | A | A | N/A |
| FP0 RTD unit | A | A | ARCT1F445E |

- A suffix " -1 " is added to the end of manual numbers when the manuals have been revised. The final number increases for every revision.
- <FPWIN GR Technical Guide Book ARCT1F332E> is supplied with the standard ladder tool software FPWIN GR.
- <FPWIN Pro Technical Guide Book ARCT1F405E> is supplied with the programming tool software FPWIN Pro.
Key Point: The PDF versions are provided at our website.

## Table of Contents

## Chapter 1 Overview

1.1 Components ..... 1-3
1.1.1 FPO Control Units ..... 1-3
1.1.2 FPO Expansion Units ..... 1-4
1.1.3 Intelligent Units ..... 1-5
1.1.4 Link Units ..... 1-5
1.1.5 Power Supply Unit ..... 1-5
1.1.6 Options and Additional Parts ..... 1-6
1.2 Expansion Possibilities ..... 1-7
1.3 Combination Possibilities ..... 1-8
1.3.1 Relay Output Type Units ..... 1-8
1.3.2 Transistor Output Type Units ..... 1-9
1.4 Programming Tools ..... 1-10
1.4.1 Discontinued Products of Programming Tool ..... 1-10
Chapter 2 Control Units
2.1 Parts and Terminology ..... 2-3
2.1.1 Control Unit Types ..... 2-4
2.1.1.1 Status Indicator LEDs ..... 2-6
2.1.1.2 Mode Switch ..... 2-6
2.1.1.3 Tool Port ..... 2-6
2.2 Specifications ..... 2-7
2.2.1 General Specifications ..... 2-7
2.2.1.1 Weight ..... 2-7
2.2.1.2 Current Consumed by the Control Unit ..... 2-8
2.2.2 Performance Specifications ..... 2-10
2.2.3 Input Specifications ..... 2-14
2.2.3.1 Limitations on Number of Simultaneous Input ON Points ..... 2-15
2.2.4 Output Specifications ..... 2-16
2.2.4.1 Relay Output Type ..... 2-16
2.2.4.2 Transistor Output Type ..... 2-17
2.3 Internal Circuit Diagram ..... 2-18
2.3.1 Relay Output Type (C10RS/C10CRS/C10RM/C10CRM/C14RS/ C14CRS/C14RM/C14CRM) ..... 2-18
2.3.2 Transistor Output Type ..... 2-19
2.3.2.1 NPN Open Collector Type (C16T/C16CT/C32T/C32CT/T32CT) ..... 2-19
2.3.2.2 PNP Open Collector Type (C16P/C16CP/C32P/C32CP/T32CP) ..... 2-21
2.4 Pin Layouts ..... 2-22
2.4.1 C10RS/C10CRS/C10RM/C10CRM ..... 2-22
2.4.2 C14RS/C14CRS/C14RM/C14CRM ..... 2-22
2.4.3 C16T/C16CT ..... 2-23
2.4.4 C16P/C16CP ..... 2-24
2.4.5 C32T/C32CT/T32CT ..... 2-25
2.4.6 C32P/C32CP/T32CP ..... 2-26
2.5 Backing Up the 10 K Step Type ..... 2-27
Chapter 3 Expansion I/O Units
3.1 Parts and Terminology ..... 3-3
3.1.1 Expansion I/O Unit Types ..... 3-4
3.2 Specifications ..... 3-6
3.2.1 General Specifications ..... 3-6
3.2.2 Input Specifications ..... 3-6
3.2.2.1 Limitations on Number of Simultaneous Input ON Points ..... 3-7
3.2.3 Output Specifications ..... 3-8
3.2.3.1 Relay Output Type ..... 3-8
3.2.3.2 Transistor Output Type ..... 3-9
3.3 Internal Circuit Diagram ..... 3-10
3.3.1 Relay Output Type (E8RS/E8RM/E16RS/E16RM) ..... 3-10
3.3.2 Transistor Output Type ..... 3-11
3.3.2.1 NPN Open Collector Type (E16T/E32T) ..... 3-11
3.3.2.2 PNP Open Collector Type (E16P/E32P) ..... 3-13
3.3.3 Expansion Input Units (E8X/E16X) ..... 3-14
3.3.4 Expansion Output Units ..... 3-15
3.3.4.1 NPN Open Collector Type (E8YT/E16YT) ..... 3-15
3.3.4.2 PNP Open Collector Type (E8YP/E16YP) ..... 3-17
3.4 Pin Layouts ..... 3-18
3.4.1 E8RS/E8RM ..... 3-18
3.4.2 E16RS/E16RM ..... 3-19
3.4.3 E16T ..... 3-20
3.4.4 E16P ..... 3-21
3.4.5 E32T ..... 3-22
3.4.6 E32P ..... 3-23
3.4.7 E8X ..... 3-24
3.4.8 E16X ..... 3-25
3.4.9 E8YT ..... 3-26
3.4.10 E8YP ..... 3-26
3.4.11 E16YT ..... 3-27
3.4.12 E16YP ..... 3-28
Chapter 4 S-LINK Control Unit
4.1 Names and Functions ..... 4-3
4.2 Specifications ..... 4-5
4.2.1 General Specifications ..... 4-5
4.2.2 S-LINK Controller Specifications ..... 4-6
4.3 Wiring the Power Supply ..... 4-7
4.3.1 Wiring to Power Supply Connector ..... 4-7
4.3.2 Wiring to S-LINK Terminal Block ..... 4-7
4.4 Sequence of Turning on Power Supplies ..... 4-9
4.5 Operation When Power Supply is Turned On ..... 4-10
4.6 S-LINK System Address Recognition ..... 4-11
4.6.1 Recognizing the Address ..... 4-11
4.6.2 Address Setting of S-LINK I/O Device ..... 4-12
4.7 Judging Errors from the Error Indicators ..... 4-13
4.8 Judging Errors Address Displays ..... 4-14
Chapter 5 I/O Allocation
5.1 I/O Number ..... 5-3
5.2 Control Unit ..... 5-4
5.3 Expansion I/O Unit ..... 5-5
Chapter 6 Installation
6.1 Adding Expansion Units ..... 6-3
6.2 Important Notes ..... 6-5
6.3 Attachment to DIN Rails ..... 6-8
6.4 Installation Using FPO Slim Type Mounting Plate ..... 6-9
6.5 Installation Using FPO Flat Type Mounting Plate ..... 6-10
Chapter 7 Wiring
7.1 Safety Instructions ..... $7-3$
7.1.1 Interlock Circuit ..... 7-3
7.1.2 Emergency Stop Circuit ..... 7-3
7.1.3 Start Up Sequence ..... 7-3
7.1.4 Momentary Power Failures ..... 7-4
7.1.5 Protecting Power Supply and Output Sections ..... 7-4
7.2 Wiring the Power Supply to the Control Unit ..... 7-5
7.3 Grounding ..... 7-7
7.4 Input Wiring ..... 7-9
7.4.1 Sensors ..... 7-9
7.4.2 LED-Equipped Reed Switch ..... 7-10
7.4.3 Two-Wire Type Sensor ..... 7-10
7.4.4 LED-Equipped Limit Switch ..... 7-11
7.5 Output Wiring ..... 7-12
7.5.1 Protective Circuit for Inductive Loads ..... 7-12
7.5.2 Precautions for Using Capacitive Loads ..... 7-13
7.6 Wiring the Terminal Type ..... 7-14
7.7 Wiring the MOLEX Connector Type ..... 7-16
7.8 Wiring the MIL Connector Type ..... 7-18
7.8.1 Contact Puller Pin for Rewiring ..... 7-19
7.9 Wiring the RS232C Port ..... 7-20
Chapter 8 Precautions During Programming
8.1 Use of Duplicated Output ..... 8-3
8.1.1 Duplicated Output ..... 8-3
8.1.2 When Output is Repeated with an OT, KP, SET, or RST Instruction ..... 8-4
8.2 Handling BCD Data ..... 8-5
8.2.1 BCD Data ..... 8-5
8.2.2 Handling BCD Data in the PLC ..... 8-5
8.3 Handling Index Registers ..... 8-7
8.3.1 Index Registers ..... 8-7
8.3.2 Memory Areas Which can be Modified with Index Registers ..... 8-7
8.3.3 Example of Using an Index Register ..... 8-8
8.4 Operation Errors ..... 8-10
8.4.1 Outline of Operation Errors ..... 8-10
8.4.2 Operation Mode When an Operation Error Occurs ..... 8-10
8.4.3 Dealing with Operation Errors ..... 8-11
8.4.4 Points to Check in Program ..... 8-12
8.5 Instruction of Leading Edge Detection Method ..... 8-13
8.5.1 Instructions of Leading Edge Detection Method ..... 8-13
8.5.2 Operation and Precautions at Run Start Time ..... 8-14
8.5.3 Precautions When Using a Control Instruction ..... 8-16
8.6 Precautions for Programming ..... 8-18
8.7 Rewrite Function During RUN ..... 8-19
8.7.1 Operation of Rewrite During RUN ..... 8-19
8.7.2 Cases Where Rewriting During Run is not Possible ..... 8-20
8.7.3 Procedures and Operation of Rewrite During RUN ..... 8-22
8.7.4 Changing Modes in FP Programmer II ..... 8-23
8.8 Changing the Set Value of Timer/Counter During RUN ..... 8-24
8.8.1 Method of Rewriting Constant in FP Programmer II ..... 8-24
8.8.2 Method of Rewriting a Value in the Set Value Area ..... 8-25
8.9 Processing During Forced Input and Output ..... 8-28
8.10 Setting the Clock/Calendar Timer (T32CT type only) ..... 8-29
Chapter 9 High-speed Counter/Pulse Output/ PWM Output
9.1 Outline of Functions ..... 9-3
9.1.1 Three Functions that Use Built-in High-speed Counter ..... 9-3
9.1.2 Performance of Built-in High-speed Counter ..... 9-4
9.2 Specifications and Restricted Items ..... 9-5
9.2.1 Specifications ..... 9-5
9.2.2 Functions and Restrictions ..... 9-7
9.3 High-speed Counter Function ..... 9-9
9.3.1 Outline of High-speed Counter Function ..... 9-9
9.3.2 Types of Input Modes ..... 9-9
9.3.3 I/O Allocation ..... 9-11
9.3.4 Instructions Used with High-speed Counter Function ..... 9-12
9.3.5 Sample Program ..... 9-14
9.4 Pulse Output Function ..... 9-18
9.4.1 Outline of Pulse Output Function ..... 9-18
9.4.2 Control Mode ..... 9-19
9.4.3 I/O Allocation and Wiring ..... 9-20
9.4.4 Instructions Used with Pulse Output Function ..... 9-22
9.4.5 Sample Program for Positioning Control ..... 9-25
9.5 PWM Output Function ..... 9-33
9.5.1 Outline of PWM Output Function ..... 9-33
9.5.2 Instruction Used with PWM Output Function ..... 9-33
Chapter 10 General-use Serial Communications
10.1 General-use Serial Communications Function ..... $10-3$
10.1.1 General-use Serial Communications ..... 10-3
10.1.2 Data Transmission ..... 10-3
10.1.3 Data Reception ..... 10-4
10.2 System Register Settings ..... 10-5
10.3 Operations When Using General-use Serial Communication ..... 10-8
10.3.1 If "None" is Set for Start and Terminal Codes ..... 10-8
10.3.2 If "Yes" has been Set for the Start and Terminal Codes (Start Code: STX, Terminal Code: ETX) ..... 10-9
Chapter 11 Self-Diagnostic and Troubleshooting
11.1 Self-Diagnostic Function ..... 11-3
11.1.1 Allowing Duplicated Output ..... 11-4
11.1.2 Continuing After an Operation Error ..... 11-4
11.2 Troubleshooting ..... 11-5
11.2.1 ERROR/ALARM LED is Blinking ..... 11-5
11.2.2 ERROR/ALARM LED is ON ..... 11-7
11.2.3 All LEDs are OFF ..... 11-7
11.2.4 Diagnosing Output Malfunction ..... 11-8
11.2.5 PROTECT ERROR is Displayed ..... 11-10
11.2.6 Program Mode does not Change to RUN ..... 11-10
Chapter 12 Specifications
12.1 Performance Specifications ..... 12-3
12.2 I/O Allocation Table ..... 12-8
12.3 Relays, Memory Areas and Constants ..... 12-11
12.4 FPO-SL1 S-LINK Address ..... 12-13
12.5 Specification: Power Supply Unit I/O Link Unit ..... 12-14
12.5.1 FPO Power Supply Unit (AFP0634) ..... 12-14
12.5.2 FPO I/O Link Unit ..... 12-14
Chapter 13 Dimensions
13.1 Control Unit and Expansion I/O Unit ..... $13-3$
13.1.1 FP0-C10RS/C10CRS/C14RS/C14CRS/ E8RS/E16RS ..... $13-3$
13.1.2 FP0-C10RM/C10CRM/C14RM/C14CRM/ E8RM/E16RM ..... $13-3$
13.1.3 FP0-C16T/C16CT/C16P/C16CP/E16T/E16P/E8X/E8YT/E8YP/ E32T/E32P/E16X/E16YT/E16YP ..... 13-4
13.1.4 FPO-C32T/C32CT/C32P/C32CP/T32CT/T32CP ..... 13-4
13.1.5 FPO S-LINK Control Unit ..... 13-5
13.2 FPO Power Supply Unit ..... 13-5
13.3 Mounting on DIN Rail ..... 13-6
13.4 FPO Slim Type Mounting Plate ..... 13-7
13.5 FPO Flat Type Mounting Plate ..... 13-8
13.6 Cable/Adapter Specifications ..... 13-9
13.6.1 AFC8503/AFC8503S ..... 13-9
13.6.2 AFC8513 ..... 13-9
13.6.3 AFC8521/AFC8523 (Programmer) ..... 13-10
13.6.4 AFC85305/AFC8531/AFC8532 (For extending for the tool port) ..... 13-10
13.7 Connection (between RS232C port and PC) ..... 13-11
Chapter 14 Appendix
14.1 System Registers / Special Internal Relays / Special Data Registers ..... 14-3
14.1.1 Table of System Registers for FPO ..... 14-5
14.1.2 Table of Special Internal Relays for FP0 ..... 14-17
14.1.3 Table of Special Data Registers for FPO ..... 14-20
14.2 Table of Basic Instructions ..... 14-30
14.3 Table of High-level Instructions ..... 14-64
14.4 Table of Error codes ..... 14-124
14.5 MEWTOCOL-COM Communication Commands ..... 14-138
14.6 Hexadecimal/Binary/BCD ..... 14-139
14.7 ASCII Codes ..... 14-140
Index ..... I-1
Record of changes ..... R-1

## Chapter 1

## Overview

1.1 Components ..... 1-3
1.1.1 FPO Control Units ..... 1-3
1.1.2 FPO Expansion Units ..... 1-4
1.1.3 Intelligent Units ..... 1-5
1.1.4 Link Units ..... 1-5
1.1.5 Power Supply Unit ..... 1-5
1.1.6 Options and Additional Parts ..... 1-6
1.2 Expansion Possibilities ..... 1-7
1.3 Combination Possibilities ..... 1-8
1.3.1 Relay Output Type Units ..... 1-8
1.3.2 Transistor Output Type Units ..... 1-9
1.4 Programming Tools ..... $1-10$

### 1.1 Components

### 1.1.1 FPO Control Units

| Product name | Built-in memory (Program capacuty) | Specifications |  |  |  |  |  | Part No. | Product No. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Number of I/O points |  | Power supply voltage | Input | Output | Connection type |  |  |
| FP0 C10 Control Unit | EEPROM <br> (2.7k steps) | 10 | Input: 6 Output: 4 | 24 V DC | $\begin{aligned} & \hline 24 \text { V DC } \\ & \text { Sink/Sourse } \\ & \text { ( } \pm \text { common) } \end{aligned}$ | Relay output: 2 A | Terminal block | FP0-C10RS | AFP02123 |
|  |  |  |  |  |  |  | Molex connector | FP0-C10RM | AFP02113 |
| FP0 C10 <br> Control Unit with RS232C port | EEPROM <br> (2.7k steps) | 10 | Input: 6 Output: 4 | 24 V DC | 24 V DC Sink/Sourse ( $\pm$ common) | Relay output: 2 A | Terminal block | FP0-C10CRS | AFP02123C |
|  |  |  |  |  |  |  | Molex connector | FP0-C10CRM | AFP02113C |
| FP0 C14 <br> Control Unit | EEPROM <br> (2.7k steps) | 14 | Input: 8 Output: 6 | 24 V DC | 24 V DC Sink/Sourse ( $\pm$ common) | Relay output: 2 A | Terminal block | FP0-C14RS | AFP02223 |
|  |  |  |  |  |  |  | Molex connector | FP0-C14RM | AFP02213 |
| FP0 C14 <br> Control Unit with RS232C port | EEPROM <br> (2.7k steps) | 14 | Input: 8 Output: 6 | 24 V DC | 24 V DC Sink/Sourse ( $\pm$ common) | Relay output: 2 A | Terminal block | FP0-C14CRS | AFP02223C |
|  |  |  |  |  |  |  | Molex connector | FP0-C14CRM | AFP02213C |
| FP0 C16 <br> Control Unit | EEPROM <br> (2.7k steps) | 16 | Input: 8 Output: 8 | 24 V DC | 24 V DC Sink/Sourse ( $\pm$ common) | Transister otuput: NPN 0.1 A | MIL connector | FP0-C16T | AFP02343 |
|  |  |  |  |  |  | Transister otuput: PNP 0.1 A |  | FP0-C16P | AFP02353 |

Notes

1) The control units and relay output type expansion units come with a power cable (part number AFP0581).
(The transistor output type expansion units need no power cable.)
2) The terminal block type relay output units have 2 terminal blocks ( 9 pins) made by Phoenix. Use a 2.5 mm .098 inch wide screwdriver.
Preferably use the specific terminal block screwdriver (part number AFP0806, Phoenix type code SZS0, 42.5 mm . 098 inch) or equivalent.
3) The connector-type relay output units have 2 connectors made by Nihon Molex (Molex type code 51067-0900, 9 pins). Use the specific Molex connector press-fit tool (part number AFP0805, Nihon Molex type code 57189-5000) or equivalent.
4) The transistor output units have a press-fit socket for wire-pressed terminal cable and contacts.
Use the press-fit tool (part number AXY52000FP) for wire-pressed terminal cable.

### 1.1.3 Intelligent Units

| Product name | Specifications |  |  | Part No. | Product No. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| FPO Thermocouple Unit | K, J, T, R thermocouple, Resolution: 0.1 C |  |  | FP0-TC4 | AFP0420 |
|  | K, J, T, R thermocouple, Resolution: 0.1 C |  |  | FP0-TC8 | AFP0421 |
| FP WebServer unit | Unit for connecting FP series/RS232C interface and Ethernet Web-Server function and E-mail sending function |  |  | FP-WEB | AFP0610 |
| FPO Analog I/O unit | Input specifications | Number or channels Input range | ```2 channels : 0 to 5 V, -10 to +10 V (Resolution: 1/4000) 0 to 20 mA (Resolution: 1/4000)``` | FPO-A21 | AFP0480 |
|  | Output specifications | Number or channels Output range | 1 channels <br> : -10 to 10 V (Resolution: $1 / 4000$ ) <br> 0 to 20 mA (Resolution: 1/4000) |  |  |
| FPO A/D Converter Unit | Input specifications | Number or channels Input range | ```8 channels : 0 to 5 V, -10 to +10 V (Resolution: 1/4000) 0 to 20 mA (Resolution: 1/4000)``` | FP0-A80 | AFP0401 |
| FPO D/A Converter Unit | Output specifications | Number or channels Output range | ```4 channels -10 to +10 V (Resolution: 1/4000) 4 to 20 mA (Resolution: 1/4000)``` | FP0-A04V | AFP04121 |
|  |  |  |  | FP0-A04I | AFP04123 |
| FPO RTD Unit | Input: 6 | Pt 100, Pt 1000, Ni 100 | Resistance | FP0-RTD6 | AFP0430 |

### 1.1.4 Link Units

| Product name | Specifications | Power supply voltage | Part No. | Product No. |
| :---: | :---: | :---: | :---: | :---: |
| FPO CCLink Slave Unit | This unit is for making the FPO function as a slave station of the CC-Link. Only one unit can be connected to the furthest right edge of the FPO expansion bus. Note: Accuracy will change if an FPO thermocouple unit is used at the same time. For details, please refer to the catalog or to the CC-Link Unit manual. | 24 V DC | FP0-CCLS | AFP07943 |
| FPO I/O Link Unit | This is a link unit designed to make the FPO function as a station to MEWNET-F (remote I/O system). | 24 V DC | FPO-IOL | AFP0732 |
| C-NET <br> adapter S2 <br> type <br> (for FPO <br> side) | This is an RS485 adapter designed to allow use of the Computer link function for connecting to a host computer via C-NET. It comes with a 30 cm FP0 tool port cable. A power supply is not required. | - | - | AFP15402 |
| C-NET adapter | This is an RS485 adapter designed to allow use of the Computer link function for connecting to a network-connected PLC via C-NET from a host computer. | 100 to 240 V DC | - | AFP8536 |
| (RS485) (for computer side) |  | 24 V DC | - | AFP8532 |
| FP <br> Web-Server <br> Unit | Connected with FP series PLCs, it conducts Ethernet communication, sends e-mail, and displays the PLC data on HTML pages. |  | FP-WEB | AFP0610 |

### 1.1.5 Power Supply Unit

| Product name | Specifications | Part No.Product <br> No. |  |
| :--- | :--- | :--- | :--- |
| FPO Power supply unit | Input voltage: 100 to 240 V AC <br> Output: 0.7 A, 24 V DC | FP0-PSA4 | AFP0634 |

### 1.1 Components

### 1.1.6 Options and Additional Parts

| Product name | Specifications |  | Product No. |
| :---: | :---: | :---: | :---: |
| FP Memory loader | Data clear type |  | AFP8670 |
|  | Data hold type |  | AFP8671 |
| Terminal screwdriver | Relay output type <br> Necessary when wiring terminals block (Phoenix Contact). |  | AFP0806 |
| Molex connector pressure contact tool | Necessary when wiring relay output type and Molex connectors. (MOLEX: 57189-5000) |  | AFP0805 |
| Multi-wire connector pressure contact tool | Necessary when wiring transistor output type connectors. |  | AFP52000FP |
| FPO Slim 30 type mounting plate | Screw-stop attachment plate for $30 \mathrm{~mm} / 1.181$ inch width the unit. |  | AFP0811 (set for 10) |
| Slim type FPO mounting plate | Screw-stop attachment plate for FP0 expansion unit. Slim model. |  | AFP0803 (set for 10) |
| Flat type FPO mounting plate | Screw-stop attachment plate for FP0 control unit. Flat model. |  | AFP0804 (set for 10) |
| Relay output Molex type I/O cable | Loose-wiring cable (9 leads) AWG20, with Molex socket attached at one end, $0.5 \mathrm{~mm}^{2}$, 1 set: 2 cables (blue \& white). | Length: $1 \mathrm{~m} / 3.281 \mathrm{ft}$. | AFP0551 (2 cable set) |
|  |  | Length: $3 \mathrm{~m} / 9.843 \mathrm{ft}$. | AFP0553 (2 cable set) |
| Transistor output type I/O cable | Wire-pressed terminal cable ( 10 leads) AWG22, $0.3 \mathrm{~mm}^{2}$ with connectors attached at one end, 1 set: 2 cables (blue \& white). | Length: $1 \mathrm{~m} / 3.281 \mathrm{ft}$. | AFP0521 (2 cable set) |
|  |  | Length: $3 \mathrm{~m} / 9.843 \mathrm{ft}$. | AFP0523 (2 cable set) |
| Flat cable connector for FPS/FP0 transistor type unit | If you are using flat cable connector, request the part specified below for a connector with an asymmetrical design to prevent mistaken polarity. (10-pin) |  | $\begin{aligned} & \text { AFP0808 } \\ & \text { (4 sockets per pack) } \end{aligned}$ |
| Terminal socket | Attaches to relay output and terminal block type. Additional part |  | AFP0802 <br> (2 sockets per pack) |
| Molex socket | Attaches to relay output and Molex connector types. Additional part |  | AFP0801 <br> (2 sockets per pack) |
| Wire-press socket | Attaches to transistor output type. Additional part |  | AFP0807 <br> (2 sockets per pack) |
| FP0 Power cable | Attaches to FP0 various units. Additional part Length: $1 \mathrm{~m} / 3.281 \mathrm{ft}$. |  | AFP0581 <br> (1 socket per pack) |

### 1.2 Expansion Possibilities

Be sure to check that the units are added according to the following restrictions:

- A maximum of three expansion I/O units or analog I/O units can be connected to one control unit.
- A combination of relay output types and transistor output types is also possible.
- The expansion unit can be attached directly to the control unit easily. Special expansion cables, backplanes, and so forth, are unnecessary as the expansion unit employs a stacking system that uses expansion connector and expansion hooks on the surface of the unit itself.
- Install the FPO thermocouple unit on the right side of all other expansion units. If it is installed on the left side, the total precision will deteriorate.
- Install the FPO CC-Link slave unit on the right side of the other expansion units. There is no expansion connector on the right side.
- Install the FPO RTD unit on the right side of the other expansion units

Contollable I/O Points

| Type of <br> control unit | Control unit <br> only | When the expansion unit is the <br> same output type as the <br> control unit | When the expansion unit is a <br> transistor output type |
| :--- | :--- | :--- | :--- |
| C10R | 10 points | max. 58 points | max. 106 points |
| C14R | 14 points | max. 62 points | max. 110 points |
| C16T/C16P | 16 points | max. 112 points | max. 112 points |
| C32/T32 | 32 points | max. 128 points | max. 128 points |

### 1.4 Programming Tools

### 1.4 Programming Tools

## Standard ladder diagram tool software "FPWIN GR Ver.2"

| Type of software |  | OS (Operating system) | Hard disc capacity | Product No. |
| :---: | :---: | :---: | :---: | :---: |
| FPWIN GR Ver. 2 English-language menu | Full type | Windows ${ }^{\circledR} 98$ Windows ${ }^{\circledR} \mathrm{Me}$ Windows ${ }^{\circledR} 2000$ Windows ${ }^{\circledR}$ XP Windows Vista ${ }^{\circledR}$ | 40 MB or more | AFPS10520 |
|  | Upgraded version |  |  | AFPS10520R |
|  | Small type |  |  | AFPS11520 |

## Notes

1) Customers who use the "FPWIN GR Ver.1" can use the "FPWIN GR Ver.2" after purchasing the upgraded version software.
(The upgrade version software can be installed only when the
"Ver.1.1" has been previously installed)
2) Small type version can be used for the "FP-e," "FPE," "FP0," "FP-X," "FP1," and "FP-M" series.
3) Ver.2.0 can be upgraded to Ver.2.1 or later free of charge at our web site
IEC61131-3-compliant programming tool software FPWIN Pro Ver. 6

| Type of <br> software | OS (Operating system) | Hard disc capacity | Product No. |
| :--- | :--- | :--- | :--- |
| FPWIN GR Ver.6 <br> English-language <br> menu | Windows $®$ 2000 <br> Windows $®$ XP <br> Windows Vista $®$ | 100 MB or more | AFPS50560 |

## Notes

1) The small type and the upgrade version is not available for Ver. 6.
2) Ver. 2.0 can be upgraded to Ver.2.1 or later free of charge at our web site

### 2.1 Parts and Terminology

There are sixteen different control unit types available:

1. C10RS terminal type
2. C14RS terminal type
3. C10CRS (with RS232C port) terminal type
4. C14CRS (with RS232C port) terminal type
5. C10RM connector type
6. C14RM connector type
7. C10CRM (with RS232C port) connector type
8. C14CRM (with RS232C port) connector type
9. C16T
10. C16P
11. C16CT (with RS232C port)
12. C16CP (with RS232C port)
13. C32T
14. C32P
15. C32CT (with RS232C port)
16. C32CP (with RS232C port)
17. T32CT (with RS232C port)
18. T32CP (with RS232C port)

In the next sections you will find a detailed description of each control unit.
2.1 Parts and Terminology

### 2.1.1 Control Unit Types

C16T/C16CT
C16P/C16CP

C10RM/C14RM C10CRM/C14CRM (connector type)

C32T/C32CT C32P/C32CP T32CT/T32CP

All control unit types

Control unit with RS232C port

(1) (7)(17) (23) Status indicator LEDs
display the operation mode and error statuses (*section 2.1.1.1).
(2) (8) (18) (24) Mode switch changes the operation mode (*section 2.1.1.2).
(3) (9) (19) (25) Tool port (RS232C) is used to connect a programming tool (*section 2.1.1.3).
(4) (10) (20) 26 Power supply connector Supply 24 V DC. It is connected using the power supply cable (AFP0581) that comes with the unit.
(5) Input terminal (9-pin)

## (6) Output terminal (9-pin)

The input and output terminals (5) and (6)) use a terminal block socket made by Phoenix Contact Co. (product number: 1840434) (*section 7.6).
(11) Input connector (9-pin)
(12) Output connector (9-pin)

The input and output connectors (11) and (12) use a connector made by Molex Co. (product number: 51067-0900) (*section 7.7).
(13) (16) Expansion hook
is used to secure expansion units. The hook is also used for installation on FPO flat type mounting plate (AFP0804).
(14) Expansion connector
connects an expansion unit to the internal circuit of the control unit (*section 6.1).
(15) DIN rail attachment lever
allows simple attachment to a DIN rail.
The lever is also used for installation on FPO slim type mounting plate (AFP0803).
(21) Input connector (10-pin)

## (22) Output connector (10-pin)

Use a MIL type connector for the input and output connectors (21) and (22)) (*section 7.8).
(27) Input connectors (10-pin $\times 2$ )
(28) Output connectors (10-pin $\times 2$ )

Use a MIL type connector for the input and output connectors (27) and (8)) (*section 7.8).
(29) RS232C port

Use this port to connect to devices with an RS232C port, such as an I.O.P., a bar code reader, or an image checker, enabling data input and output. (*section 7.9).

### 2.1 Parts and Terminology

### 2.1.1.1 Status Indicator LEDs

These LEDs display the current mode of operation or the occurrence of an error.

| LED | Description |
| :--- | :--- |
| RUN (green) | Illuminates when in the RUN mode and indicates the execution of a program. It flashes during <br> forced input/output. |
| PROG. (green) | Illuminates when in the PROG. mode and indicates that operation has stopped. |
| ERROR/ALARM <br> (red) | Flashes when an error is detected during the self-diagnostic function. Illuminates if a hard- <br> ware error occurs, or if operation slows because of the program, and the watchdog timer is <br> activated. |

### 2.1.1.2 Mode Switch

This switch turns ON and OFF (RUN/PROG.) the operation of the FPO. The FPO can also be turned ON and OFF by the programming tool.

| Switch position | Operation mode |
| :--- | :--- |
| RUN (upward) | This sets the RUN mode. The program is executed and operation begins. |
| PROG. (downward) | This sets the PROG. mode. |

When performing remote switching from the programming tool, the position of the mode switch and the actual mode of operation may differ. Verify the mode with the status indicator LED. Otherwise, restart the FPO and change the mode of operation with the mode switch.

### 2.1.1.3 Tool Port

The tool port is used to connect a programming tool.
Pin assignment

| Pin no. | Abbreviation |
| :---: | :---: |
| 1 | - |
| 2 | SD (TXD) |
| 3 | SG |
| 4 | RD (RXD) |
| 5 | +5 V |

### 2.2 Specifications

### 2.2.1 General Specifications

| Item |  | Description |
| :---: | :---: | :---: |
| Rated operating voltage |  | 24 V DC |
| Operating voltage range |  | 21.6 V to 26.4 V DC |
| Rated current consumption |  | 300 mA or less (*section 2.2.1.2) |
| Allowed momentary power off time | C10/C14 | 5 ms at $21.6 \mathrm{~V}, 10 \mathrm{~ms}$ at 24 V |
|  | $\begin{aligned} & \text { C16/C32 } \\ & \text { T32/SL1 } \end{aligned}$ | 10 ms at $21.6 \mathrm{~V}, 10 \mathrm{~ms}$ at 24 V |
| Ambient temperature |  | $0^{\circ} \mathrm{C}$ to $+55^{\circ} \mathrm{C} / 32{ }^{\circ} \mathrm{F}$ to $+131^{\circ} \mathrm{F}$ |
| Storage temperature |  | $-20^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C} /-4^{\circ} \mathrm{F}$ to $+158{ }^{\circ} \mathrm{F}$ |
| Ambient humidity |  | $30 \%$ to $85 \%$ RH (non-condensing) |
| Storage humidity |  | $30 \%$ to $85 \%$ RH (non-condensing) |
| Breakdown voltage |  | 500 V AC for 1 minute between I/O terminal and power supply/ground terminal 1500 V AC for 1 minute between I/O terminal and power supply/ground terminal (relay output type only) |
| Insulation resistance |  | min. $100 \mathrm{M} \Omega$ (measured with a 500 V DC megger) between I/O terminal and ground terminal |
| Vibration resistance |  | 10 Hz to $55 \mathrm{~Hz}, 1$ cycle/min: double amplitude of $0.75 \mathrm{~mm} / 0.030 \mathrm{in}$., 10 min on 3 axes |
| Shock resistance |  | Shock of $98 \mathrm{~m} / \mathrm{s}^{2}$ or more, 4 times on 3 axes |
| Noise immunity |  | $1,000 \mathrm{Vp}-\mathrm{p}$ with pulse widths 50 ns and $1 \mu \mathrm{~s}$ (based on in-house measurements) |
| Operating condition |  | Free from corrosive gases and excessive dust |

### 2.2.1.1 Weight

| Type | Weight | Type | Weight |
| :--- | :--- | :--- | :--- |
| C10 | approx. $100 \mathrm{~g} / 3.53 \mathrm{oz}$ | SL1 | approx. $120 \mathrm{~g} / 4.24 \mathrm{oz}$ |
| C14 | approx. $105 \mathrm{~g} / 3.70 \mathrm{oz}$ | A21 | approx. $80 \mathrm{~g} / 2.82 \mathrm{oz}$ |
| C16 | approx. $85 \mathrm{~g} / 3.00 \mathrm{oz}$ | A80 | approx. $90 \mathrm{~g} / 3.18 \mathrm{oz}$ |
| C32 | approx. $115 \mathrm{~g} / 4.06 \mathrm{oz}$ | IOL, TC4 | approx. $85 \mathrm{~g} / 3.00 \mathrm{oz}$ |
| T32 | approx. $125 \mathrm{~g} / 4.41 \mathrm{oz}$ | TC8 | approx. $95 \mathrm{~g} / 3.35 \mathrm{oz}$ |
| E8R/E8YR | approx. $90 \mathrm{~g} / 3.17 \mathrm{oz}$ | CCLS | approx. $80 \mathrm{~g} / 2.82 \mathrm{oz}$ |
| E8X/E8YT/E8YP | approx. $65 \mathrm{~g} / 2.29 \mathrm{oz}$ | A04V/A04I/RTD6 | approx. $75 \mathrm{~g} / 2.65 \mathrm{oz}$ |
| E16RS/E16RM | approx. $105 \mathrm{~g} / 3.70 \mathrm{oz}$ |  |  |
|  | approx. $70 \mathrm{~g} / 2.47 \mathrm{oz}$ |  |  |
| E32T/E32P | approx. $85 \mathrm{~g} / 3.00 \mathrm{oz}$ |  |  |

### 2.2 Specifications

### 2.2.1.2 Current Consumed by the Control Unit

| Unit type |  | Control unit (The current consumed by the control unit power supply connector. If expansion units or intelligent units are added, the current is increased by the value indicated below.) | Expansion unit (The current consumed by the expansion unit power supply connector. If a unit is not listed below, it means that it has no power supply connector.) | Input circuit (The current consumed by the input circuits of the various units. The value indicates the current that flows into the input circuit. ) | Output circuit (The current consumed by the output circuits of the various units. The value indicates the current used to drive the output circuit. The value does not include the load current value.) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| FPO Control unit | FP0-C10 | 100 mA or less | - | 25.8 mA or less | - |
|  | FP0-C14 | 100 mA or less | - | 34.4 mA or less | - |
|  | FP0-C16 | 40 mA or less | - | 34.4 mA or less | 28 mA or less |
|  | $\begin{array}{\|l\|} \hline \text { FPO-C32 } \\ \text { FPO-T32 } \end{array}$ | 60 mA or less | - | 68.8 mA or less | 52 mA or less |
| S-LINK Control unit | FP0-SL1 | 150 mA or less | - | - | - |
| FPO Expansion | FP0-E8X | 10 mA or less | - | 34.4 mA or less | - |
|  | FP0-E8R | 15 mA or less | 50 mA or less | 17.2 mA or less | - |
|  | FP0-E8YR | 10 mA or less | 100 mA or less | - | - |
|  | FP0-E8YT/P | 15 mA or less | - | - | 24 mA or less |
|  | FP0-E16X | 20 mA or less | - | 68.8 mA or less | - |
|  | FP0-E16R | 20 mA or less | 100 mA or less | 34.4 mA or less | - |
|  | FP0-E16T/P | 25 mA or less | - | 34.4 mA or less | 24 mA or less |
|  | FP0-E16YT/P | 25 mA or less | - | - | 48 mA or less |
|  | FP0-E32T/P | 40 mA or less | - | 68.8 mA or less | 48 mA or less |
| FPO Intelligent | FP0-A21 | 20 mA or less | 100 mA or less | - | - |
|  | FP0-A80 | 20 mA or less | 60 mA or less | - | - |
|  | FP0-A04V | 20 mA or less | 100 mA or less | - | - |
|  | FP0-A04I | 20 mA or less | 130 mA or less | - | - |
|  | $\begin{array}{\|l\|} \hline \text { FP0-TC4, } \\ \text { FP0-TC8, } \\ \text { FP0-RTD6 } \end{array}$ | 25 mA or less | - | - | - |
|  | FPO-IOL | 30 mA or less | 40 mA or less | - | - |
|  | FP0-CCLS | 40 mA or less | 40 mA or less | - | - |
| Programmable display unit | GT01,GT01R (5VDC,RS232 C) | 80 mA or less | - | - | - |

## Current consumption example

### 2.2 Specifications

### 2.2.2 Performance Specifications

| Item |  |  | Relay output type |  | Transistor output type |  |  | S-LINK |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

|  | Operation memory |  | Areas which are held if the power supply fails are fixed, and are retained by the EEPROM. <br> - Number of points/words of the fixed hold areas in the various memories <br> Counters: 4 points Internal relays: 32 points Date registers: 8 words (* Note 13) |  |  | Areas which are held if the power supply fails are fixed, and are retained by the EEPROM. <br> - Number of points/ words of the fixed hold areas in the various memories <br> Counters: 16 points <br> Internal re lays: 128 points Date registers: 32 words (* Note 14) | The opera tion memory is backed up using built-in chargeable (secondary ) battery, so the hold type memory areas can be specified using the programming tools. <br> (* Note 11) <br> - Memory areas which can be specified: Timers, Counters, Internal re lays, Data registers | Areas which are held if the power supply fails are fixed, and are retained by the EEROM. <br> - Number of points/ words of the fixed hold areas in the various memories Counters: 16 points <br> Internal relays: 128 points Date registers: 32 words (* Note 14) |
|  | Backup by the F12/F13 instruction |  | Available for all data registers |  |  |  |  |  |

## Notes

1) Hold or non-hold type can be set using the system registers.
2) The proportion of timer points to counter points can be changed using a system register 5 .
3) Precision of calender timer: At $0^{\circ} \mathrm{C} / 32^{\circ} \mathrm{F}$, less than 139 second error per month. At $25^{\circ} \mathrm{C} / 77^{\circ} \mathrm{F}$, less than 72 seconds error per month. At $55^{\circ} \mathrm{C} / 131^{\circ} \mathrm{F}$, less than 169 seconds error per month. This accuracy is considered to be the worst fluctuation coefficient value based on fluctuations in the normal voltage of 5 V and the battery backup voltage of 3V. Also, F157 and F158 (time/date addition and subtraction instructions) cannot be used.
4) When using the RS232C port for communication, we recommend using resend processing. The driver IC for the RS232C is in full conformance with EIA/TIA-232E and CCITT V. 28 standards.
5) The combinations 1 phase $\times 2$ channels and 2 phases $\times 1$ channel are also possible for the high-speed counter.
6) The internal relay, data register, and timer/counter hold areas of the T32CT control unit (10 k step type) can be changed by the system registers. The number of points in the table is the value when the system registers are initial values.
7) The max. counting speed $(10 \mathrm{kHz})$ is the counting speed with a rated input voltage of 24 V DC and an ambient temperature of $25^{\circ} \mathrm{C}$. The counting speed (frequency) will decrease depending on the voltage and temperature.
8) If both reset inputs $X 0$ and $X 1$ are reset, $X 2$ will be the reset input of X 1 . In the same way, for X3 and X4, X5 acts as the reset input of X4.
9) With a CPU of Ver. 1.2 or a subsequent version, the frequency will be 0.15 Hz to 1 kHz .
10) The maximum is 9.5 kHz when the positioning control instruction (F168) is executed.
11) Precautions when using the battery backup function Secondary (chargeable) battery is used as backup battery in the FPO T32C control unit. The battery is not charged before the unit is shipped, so please make sure that the built-in backup battery have been charged before using the unit.
12) The program, system resisters and the hold type areas (internal relay, data register and counter) are backed up by the built in EEPROM.
13) The possible number of write times by the EEPROM write instruction is 100,000 or less.
14) The possible number of write times by the EEPROM write instruction is 10,000 or less.
15) If the power supply is turned off while the P13 instruction is being executed, the data written by the P13 instruction may not be written in the EEPROM properly. Also, the area where the internal relays, data registers and timer/counter are held may not be held properly. Do not turn off the power supply while the P13 instruction is being executed.

### 2.2 Specifications

### 2.2.3 Input Specifications

| Item | Description |  |
| :--- | :--- | :--- |
| Insulation method | optical coupler |  |
| Rated input voltage | 24 V DC |  |
| Rated input current | approx. 4.3 mA (at 24 V DC) |  |
| Input impedance | approx. $5.6 \mathrm{k} \mathrm{\Omega}$ |  |
| Operating voltage range | 21.6 to 26.4 V DC |  |
| Input points per <br> common (*Note 1) | C10RM, <br> C10CRM, <br> C10RS, <br> C10CRS | 6 points/common |
|  | C14RM, <br> C14CRM, <br> C14RS, <br> C14CRS | 8 points/common |
| C16T, C16CT, <br> C16P, C16CP | 8 points/common |  |
|  | C32T, C32CT, <br> C32P, C32CP <br> T32CT, <br> T32CP | 16 points/common |

## Notes

1) Either positive or negative polarity is possible for the input voltage supply.
2) $X 0$ through $X 5$ are inputs for the high-speed counter and have a fast response time. If used as normal inputs, we recommend inserting a timer in the ladder program as chattering and noise may be interpreted as an input signal.

### 2.2.3.1 Limitations on Number of Simultaneous Input ON Points

Keep the number of input points per common which are simultaneously ON within the following range as determined by the temperature.

## FP0-C14RM/C14CRM/C14RS/C14CRS

## FP0-C16T/C16CT/C16P/C16CP

FP0-C32T/C32CT/C32P/C32CP/T32CT/T32CP
at 26.4 V DC
Number of input points per common which are simultaneous ON

Ambient temperature $\left({ }^{\circ} \mathrm{C} /{ }^{\circ} \mathrm{F}\right)$

### 2.2 Specifications

### 2.2.4 Output Specifications

### 2.2.4.1 Relay Output Type

FP0 relay output types: C10RM, C10CRM, C10RS, C10CRS, C14RM, C14CRM, C14RS, C14CRS

| Item | Description |  |
| :--- | :--- | :--- |
| Output type | Normally open (1 Form A) relay output |  |
| Rated control capacity | 2 A 250 V AC, 2 A 30 V DC (4.5 A maximum per common) <br> (at Resistance load) |  |
| Output points per <br> common | C10RM, <br> C10CRM, <br> C10RS, <br> C10CRS | 2 points/common +1 point/common +1 point/common |
|  | C14RM, <br> C14CRM, <br> C14RS, <br> C14CRS | 4 points/common + 1 point/common + 1 point/common |
| Response time | OFF $\rightarrow$ ON |  |
|  | ON $\rightarrow$ OFF | approx. 10 ms |
| Mechanical life time | approx. 8 ms |  |
| Electrical life time | $20,000,000$ operations or more |  |
| Surge absorber | 100,000 operations or more |  |
| Operating mode indicator | None |  |

### 2.2.4.2 Transistor Output Type

FP0 transistor output types: C16T, C16CT, C16P, C16CP, C32T, C32CT, C32P, C32CP, T32CT, T32CP

| Item | Description |
| :--- | :--- |
| Insulation method | optical coupler |
| Output type | open collector |
| Rated load voltage | NPN open collector type: 5 to 24 V DC ( $^{*}$ Note) <br> PNP open collector type: 24 V DC |
| Operating load voltage range | NPN open collector type: 4.75 to 26.4 V DC <br> PNP open collector type: 21.6 to 26.4 V DC |
| Max. load current | 0.1 A |
| Max. surge current | 0.3 A |
| Output points per <br> common | C16T, C16CT, <br> C16P, C16CP |
|  | C32T, C32CT, <br> C32P, C32CP <br> T32CT, <br> T32CP |

## Note

For NPN open collector type, able to be used with different voltages for the load voltage and the external power supply for driving the internal circuit.

### 2.3 Internal Circuit Diagram

### 2.3.1 Relay Output Type

(C10RS/C10CRS/C10RM/C10CRM/C14RS/C14CRS/C14RM/C14CRM)
FP0-C10RS/C10CRS/C10RM/C10CRM/C14RS/C14CRS/C14RM/C14CRM

1) The resistor in the control unit is $2 \mathrm{k} \Omega$ for $X 0$ through $X 5$, and 1 $\mathrm{k} \Omega$ for X6 and X7.
2) Either positive or negative polarity is possible for the input voltage supply.

### 2.3.2 Transistor Output Type

### 2.3.2.1 NPN Open Collector Type (C16T/C16CT/C32T/C32CT/T32CT)

## When the load voltage and external power supply are the same

This example is when the values of the rated load voltage and external power supply for driving internal circuit are the same. In this situation, there is only one power supply.

## FPO-C16T/C16CT/C32T/C32CT

1) The resistor in the control unit is $2 k \Omega$ for $X 0$ through $X 5$, and 1 $\mathrm{k} \Omega$ for X6 through XF.
2) Either positive or negative polarity is possible for the input voltage supply.

### 2.3 Internal Circuit Diagram

When the load voltage differs from the 24 V DC external power supply for the driving the internal circuit
Other than 24 V DC load voltage, 5 V DC and 12 V DC and other load voltages can be connected.

## FP0-C16T/C16CT/C32T/C32CT/T32CT

## Notes

1) The resistor in the control unit is $2 \mathrm{k} \Omega$ for $X 0$ through $X 5$, and 1 k $\Omega$ for X6 through XF.
2) Either positive or negative polarity is possible for the input voltage supply.

### 2.3.2.2 PNP Open Collector Type (C16P/C16CP/C32P/C32CP/T32CP)

## FP0-C16P/C16CP/C32P/C32CP/T32CP

1) The resistor in the control unit is $2 \mathrm{k} \Omega$ for $X 0$ through $X 5$, and 1 $\mathrm{k} \Omega$ for X6 through XF.
2) Either positive or negative polarity is possible for the input voltage supply.

### 2.4 Pin Layouts

### 2.4 Pin Layouts

| Y3 | Load |
| COM | Power supply |
| Y 4 | Load |
| COM | Power supply |
| Y 5 | Load |
| COM | Power supply |

C14RS/C14CRS C14RM/C14CRM

## Note

Either positive or negative polarity is possible for the input voltage supply.

### 2.4.3 C16T/C16CT

## Notes

- The two COM terminals of input terminal (X0-7) are connected internally, however they should be externally connected as well.

1) Either positive or negative polarity is possible for the input voltage supply.

### 2.4 Pin Layouts

### 2.4.4 C16P/C16CP

Notes

- The two COM terminals of input terminal (XO-7) are connected internally, however they should be externally connected as well.

1) Either positive or negative polarity is possible for the input voltage supply.

### 2.4.5 C32T/C32CT/T32CT

## Notes

- The four COM terminals of input terminals (X0-7 and X8-F) are connected internally, however they should be externally connected as well.
- The ( + ) terminals of output terminals (YO-7) and output terminals (Y8-F) are connected internally, however they should be externally connected as well.
- The (-) terminals of output terminals (YO-7) and output terminals (Y8-F) are connected internally, however they should be externally connected as well.

1) Either positive or negative polarity is possible for the input voltage supply.

### 2.4.6 C32P/C32CP/T32CP

Notes

- The four COM terminals of input terminals (X0-7 and X8-F) are connected internally, however they should be externally connected as well.
- The (+) terminals of output terminals (YO-7) and output terminals (Y8-F) are connected internally, however they should be externally connected as well.
- The (-) terminals of output terminals (YO-7) and output terminals (Y8-F) are connected internally, however they should be externally connected as well.

1) Either positive or negative polarity is possible for the input voltage supply.

### 2.5 Backing Up the 10 K Step Type

## Recharging the internal backup battery

A secondary battery (rechargeable type) is used as the backup battery in the control unit ( 10 K step type). When shipped, this battery is not charged; therefore, please make sure it is sufficiently charged before using. Recharging is automatic when DC power is supplied.

## When backup is possible of operation memory

Relationship between recharging time and backup time
The number of days for the backup time changes with the proportion of recharging time. Please use the graph below to verify the number of days for the backup time.

Number of days for backup depending on ambient temperature
The number of days for the backup differs, as shown in the table below, when recharging is done for 72 hours at a certain ambient temperature.

| Ambient temperature | Number of days for backup time |
| :--- | :--- |
| $70^{\circ} \mathrm{C}$ | Approx. 14 days |
| $25^{\circ} \mathrm{C}$ | Approx. 50 days |
| -20 C | Approx. 25 days |

### 2.5 Backing Up the 10 K Step Type

## Predicted life of internal backup battery

When the control unit is on (when power is supplied) the internal backup battery life will differ depending on the ambient temperature. Refer to the table below to predict the life of the internal backup battery.

Note: When the control unit is off (when power is not supplied), temperature has almost no effect on the battery life.

| Ambient temperature | Internal backup battery life |
| :--- | :--- |
| $\mathbf{5 5}{ }^{\circ} \mathbf{C}$ | Approx. 430 days (approx. 1 year) |
| $\mathbf{4 5}{ }^{\circ} \mathbf{C}$ | Approx. 1,200 days (approx. 3 years) |
| $\mathbf{4 0}{ }^{\circ} \mathbf{C}$ | Approx. 2,100 days (approx. 6 years) |
| $\mathbf{3 5}{ }^{\circ} \mathbf{C}$ | Approx. 3,300 days (approx. 9 years) |
| $\mathbf{3 4}{ }^{\circ} \mathbf{C}$ and less | Approx. 10 years |

## Range of backup possible with the internal backup battery

- The range that the user specifies with the programming tool from among the computation memories given below, will become the holding backup area.

1) Timer/counter (T/C)
2) Internal relay (R)
3) Data register (DT)
4) Step ladder

- If the user does not make a designation, the default setting range will become the backup holding area.
- The clock/calendar timer value is also backed up.
- The program and system registers are held in EEPROM with no relation to the internal backup battery.

## Handling of the internal backup battery

It is not possible to replace the internal backup battery when it has been exhausted or has exceeded its life span.

## Cautions regarding the backup of data

- The clock/calendar timer value is backed up by the secondary battery.
- Begin use only after the secondary battery has been sufficiently charged.

## For reference

To read and use the initial settings data when starting operation, you can also write the data to EEPROM by using the F12 EEPROM read instruction and the F13 EEPROM write instruction. If the power supply is turned off while the P13 instruction is being executed, data may not be written in the EEPROM properly.
Also, the area where the internal relays, data registers and timer/counter are held may not be held properly.
Do not turn off the power supply while the P13 instruction is being executed.

### 3.1 Parts and Terminology

There are fourteen different expansion I/O unit types available:

1. E8RS terminal type
2. E16RS terminal type
3. E8RM connector type
4. E16RM connector type
5. E16T
6. E16P
7. E32T
8. E32P
9. E8X input type
10. E16X input type
11. E8YT output type
12. E8YP output type
13. E16YT output type
14. E16YP output type

In the next sections you will find a detailed description of each expansion I/O unit.
3.1 Parts and Terminology

### 3.1.1 Expansion I/O Unit Types

All expansion I/O unit types

3-4
(1) (4) Power supply connector

Supply 24 V DC. It is connected using the power supply cable (AFP0581) that comes with the unit.
(2) Input terminal (9-pin)
(3) Output terminal (9-pin)

The input and output terminals (2) and (3)) use a terminal block socket made by Phoenix Contact Co. (product number: 1840434) (*section 7.6).
(5) Input connector (9-pin)
(6) Output connector (9-pin)

The input and output connectors (5) and (6) use a connector made by Molex Japan Co. (product number: 51067-0900) (*section 7.7).
(7) (11) Input connector (10-pin)
(8) (13) Output connector (10-pin)
(9) (12) Input connector (10-pin $\times 2$ )
(10) (14) Output connector (10-pin $\times 2$ )

Use a MIL type connector for the input and output connectors (7) to (14) (*section 7.8).
(15) (18) Expansion hook
is used to secure expansion units.
(16) Expansion connector
connects an expansion unit to the internal circuit of the expansion I/O unit (*section 6.1).
(17) DIN rail attachment lever
allows simple attachment to a DIN rail.
The lever is also used for installation on FPO slim type mounting plate (AFP0803).

### 3.2 Specifications

### 3.2 Specifications

### 3.2.1 General Specifications

For more details on the general specifications, refer to section 2.2.1.

### 3.2.2 Input Specifications

| Item |  | Description |
| :---: | :---: | :---: |
| Insulation method |  | optical coupler |
| Rated input voltage |  | 24 V DC |
| Rated input current |  | approx. 4.3 mA (at 24 V DC) |
| Input impedance |  | approx. $5.6 \mathrm{k} \Omega$ |
| Operating voltage range |  | 21.6 to 26.4 V DC |
| Input points per common (* Note) | E8RS, E8RM | 4 points/common |
|  | E16RS, E16RM, E16T, E16P, E8X | 8 points/common |
|  | $\begin{aligned} & \text { E32T, E32P, } \\ & \text { E16X } \end{aligned}$ | 16 points/common |
| ON voltage/ON current |  | 19.2 V or less/3 mA or less |
| OFF voltage/OFF current |  | 2.4 V or more/1 mA or more |
| Response time (at 24 V DC and $25^{\circ} \mathrm{C} / 66^{\circ} \mathrm{F}$ ) | OFF $\leftrightarrow$ ON | 2 ms or less |
|  | ON $\leftrightarrow$ OFF | the same as above |
| Operating mode indicator |  | LED |

Note
Either positive or negative polarity is possible for the input voltage supply.

### 3.2.2.1 Limitations on Number of Simultaneous Input ON Points

Keep the number of input points per common which are simultaneously ON within the following range as determined by the temperature.

## FP0-E16T/E16P/E8X

$$
\text { at } 26.4 \mathrm{~V} \text { DC }
$$

Ambient temperature ( ${ }^{\circ} \mathrm{C} /{ }^{\circ} \mathrm{F}$ )

## FPO-E32T/E32P/E16X

### 3.2 Specifications

### 3.2.3 Output Specifications

### 3.2.3.1 Relay Output Type

FPO relay output types: E8RS, E8RM, E16RS, and E16RM

| Item |  | Description |
| :---: | :---: | :---: |
| Output type |  | Normally open (1 Form A) relay output |
| Rated control c | pacity | 2 A 250 V AC, 2 A 30 V DC (4.5 A maximum per common) (at Resistance load) |
| Output points per common | E8RS, <br> E8RM | 4 points/common |
|  | E16RS, E16RM | 8 points/common |
| Response time | OFF $\leftrightarrow$ ON | approx. 10 ms |
|  | ON $\leftrightarrow$ OFF | approx. 8 ms |
| Mechanical life | ime | 20,000,000 operations or more |
| Electrical life tim |  | 100,000 operations or more |
| Surge absorber |  | None |
| Operating mode | indicator | LED |

### 3.2.3.2 Transistor Output Type

FP0 transistor output types: E16T, E16P, E32T, E32P, E8YT, E8YP, E16YT, E16YP

| Item | Description |
| :--- | :--- |
| Insulation method | optical coupler |
| Output type | open collector |\(\left|\begin{array}{l}NPN open collector type: 5 to 24 \mathrm{~V} \mathrm{DC} \mathrm{(*} \mathrm{Note)} <br>

PNP open collector type: 24 \mathrm{~V} DC\end{array}\right|\)

## Note

For NPN open collector type, able to be used with different voltages for the load voltage and the external power supply for driving the internal circuit.

### 3.3 Internal Circuit Diagram

### 3.3 Internal Circuit Diagram

### 3.3.1 Relay Output Type (E8RS/E8RM/E16RS/E16RM)

## FP0-E8RS/E8RM/E16RS/E16RM

## Notes

- Either positive or negative polarity is possible for the input voltage supply.
- The I/O number given above is the $I / O$ number when the expansion I/O unit is installed as the first expansion unit (*section 5.3).

### 3.3.2 Transistor Output Type

### 3.3.2.1 NPN Open Collector Type (E16T/E32T)

## When the load voltage and external power supply are the same

This example is when the values of the rated load voltage and external power supply for driving internal circuit are the same. In this situation, there is only one power supply.

- Either positive or negative polarity is possible for the input voltage supply.
- The $I / O$ number given above is the $I / O$ number when the expansion I/O unit is installed as the first expansion unit (*section 5.3).

### 3.3 Internal Circuit Diagram

When the load voltage differs from the 24 V DC external power supply for the driving the internal circuit
Other than 24 V DC load voltage, 5 V DC and 12 V DC and other load voltages can be connected.

## FP0-E16T/E32T

Notes

- Either positive or negative polarity is possible for the input voltage supply.
- The I/O number given above is the $I / O$ number when the expansion I/O unit is installed as the first expansion unit (*section 5.3).

### 3.3.2.2 PNP Open Collector Type (E16P/E32P)

## FP0-E16P/E32P

## Notes

- Either positive or negative polarity is possible for the input voltage supply.
- The $I / O$ number given above is the $I / O$ number when the expansion I/O unit is installed as the first expansion unit (*section 5.3).

### 3.3 Internal Circuit Diagram

### 3.3.3 Expansion Input Units (E8X/E16X)

## FP0-E8X/E16X

## Notes

- Either positive or negative polarity is possible for the input voltage supply.
- The input number given above is the input number when the expansion input unit is installed as the first expansion unit (*section 5.3).

### 3.3.4 Expansion Output Units

### 3.3.4.1 NPN Open Collector Type (E8YT/E16YT)

When the load voltage and external power supply are the same
This example is when the values of the rated load voltage and external power supply for driving the internal circuit are the same. In this situation, there is only one power supply.

## FP0-E8YT/E16YT

## Note

The output number given above is the output number when the expansion output unit is installed as the first expansion unit (*section 5.3).

### 3.3 Internal Circuit Diagram

When the load voltage differs from the 24 V DC external power supply for the driving the internal circuit
Other than 24 V DC load voltage, 5 V DC and 12 V DC and other load voltages can be connected.

## FP0-E8YT/E16YT

## Note

The output number given above is the output number when the expansion output unit is installed as the first expansion unit (*section 5.3).

### 3.3.4.2 PNP Open Collector Type (E8YP/E16YP)

## FP0-E8YP/E16YP

Note
The output number given above is the output number when the expansion output unit is installed as the first expansion unit (*section 5.3).

### 3.4 Pin Layouts

### 3.4 Pin Layouts

### 3.4.1 E8RS/E8RM

Output

- Either positive or negative polarity is possible for the input voltage supply.
- The I/O number given above is the I/O number when the expansion I/O unit is installed as the first expansion unit. The I/O numbers for the expansion I/O units will differ depending on the location where they are installed (*section 5.3).

### 3.4.2 E16RS/E16RM

Input

Output

| Y 20 | Load |
| :--- | :--- |
| Y 21 | Load |
| Y 22 | Load |
| Y 23 | Load |
| Y 24 | Load |
| Y 25 | Load |
| Y 26 | Load |
| Y 27 | Load |
| COM | Power <br> supply |

## Notes

- Either positive or negative polarity is possible for the input voltage supply.
- The $I / O$ number given above is the $I / O$ number when the expansion I/O unit is installed as the first expansion unit. The I/O numbers for the expansion I/O units will differ depending on the location where they are installed (*section 5.3).

### 3.4 Pin Layouts

### 3.4.3 E16T

Input

- The two COM terminals of input terminals are connected internally, however they should be externally connected as well.

1) Either positive or negative polarity is possible for the input voltage supply.

- The I/O number given above is the I/O number when the expansion I/O unit is installed as the first expansion unit. The I/O numbers for the expansion I/O units will differ depending on the location where they are installed (*section 5.3).

### 3.4.4 E16P

Output

## Notes

- The two COM terminals of input terminals are connected internally, however they should be externally connected as well.

1) Either positive or negative polarity is possible for the input voltage supply.

- The I/O number given above is the I/O number when the expansion I/O unit is installed as the first expansion unit. The I/O numbers for the expansion I/O units will differ depending on the location where they are installed (*section 5.3).

### 3.4 Pin Layouts

### 3.4.5 E32T

Notes

- The four COM terminals of input terminals are connected internally, however they should be externally connected as well.
- The two (+) terminals of output terminals are connected internally, however they should be externally connected as well.
- The two (-) terminals of the output terminals are connected internally, however they should be externally connected as well.

1) Either positive or negative polarity is possible for the input voltage supply.

- The I/O number given above is the I/O number when the expansion I/O unit is installed as the first expansion unit. The I/O numbers for the expansion I/O units will differ depending on the location where they are installed (*section 5.3).

### 3.4.6 E32P

## Notes

- The four COM terminals of input terminals are connected internally, however they should be externally connected as well.
- The two (+) terminals of output terminals are connected internally, however they should be externally connected as well.
- The two (-) terminals of the output terminals are internally connected, however they should be externally connected as well.

1) Either positive or negative polarity is possible for the input voltage supply.

- The I/O number given above is the I/O number when the expansion I/O unit is installed as the first expansion unit. The I/O numbers for the expansion I/O units will differ depending on the location where they are installed (*section 5.3).

### 3.4 Pin Layouts

### 3.4.7 E8X

## Notes

- The two COM terminals of input terminals are connected internally, however they should be externally connected as well.

1) Either positive or negative polarity is possible for the input voltage supply.

- The input number given above is the input number when the expansion input unit is installed as the first expansion unit. The input numbers for the expansion input units will differ depending on the location where they are installed (*section 5.3).

### 3.4.8 E16X

## Notes

- The four COM terminals of input terminals are connected internally, however they should be externally connected as well.

1) Either positive or negative polarity is possible for the input voltage supply.

- The input number given above is the input number when the expansion input unit is installed as the first expansion unit. The input numbers for the expansion input units will differ depending on the location where they are installed (*section 5.3).

### 3.4 Pin Layouts

### 3.4.9 E8YT

Output

### 3.4.10 E8YP

## Note

The output number given above is the output number when the expansion output unit is installed as the first expansion unit. The output numbers for the expansion output units will differ depending on the location where they are installed (*section 5.3).

### 3.4.11 E16YT

- The two (+) terminals of the output terminals are connected internally, however they should be externally connected as well.
- The two (-) terminals of the output terminals are connected internally, however they should be externally connected as well.
- The output number given above is the output number when the expansion output unit is installed as the first expansion unit. The output numbers for the expansion output units will differ depending on the location where they are installed (*section 5.3).

### 3.4 Pin Layouts

### 3.4.12 E16YP

Notes

- The two (+) terminals of the output terminals are connected internally, however they should be externally connected as well.
- The two (-) terminals of the output terminals are connected internally, however they should be externally connected as well.
- The output number given above is the output number when the expansion output unit is installed as the first expansion unit. The output numbers for the expansion output units will differ depending on the location where they are installed (*section 5.3).

## Chapter 4

## S-LINK Control Unit

4.1 Names and Functions ..... 4-3
4.2 Specifications ..... 4-5
4.2.1 General Specifications ..... 4-5
4.2.2 S-LINK Controller Specifications ..... 4-6
4.3 Wiring the Power Supply ..... 4-7
4.3.1 Wiring to Power Supply Connector ..... 4-7
4.3.2 Wiring to S-LINK Terminal Block ..... 4-7
4.4 Sequence of Turning on Power Supplies ..... 4-9
4.5 Operation When Power Supply is Turned On ..... 4-10
4.6 S-LINK System Address Recognition ..... 4-11
4.6.1 Recognizing the Address ..... 4-11
4.6.2 Address Setting of S-LINK I/O Device ..... 4-12
4.7 Judging Errors from the Error Indicators ..... 4-13
4.8 Judging Errors Address Displays ..... 4-14

### 4.1 Names and Functions

(1) Status indicator LED

The LED display the operation mode and error statuses.
(2) ERROR ADDRESS display (2-digit hexadecimal display)

The address at which the S-LINK system error occurred is displayed.
(3) Mode switch

The mode switch changes the operation mode.
(4) Transmission indicator (SEND)

This flashes when input or output data is transmitted between the various units of the S-LINK system.
(5) ERROR indicators

These light if an error occurs in the S-LINK system.
ERR1 (Error 1): Short circuit between D - G line.
ERR2: Unused
ERR3 (Error 3): Abnormal voltage level between D - G line.
ERR4 (Error 4): Broken wire or S-LINK I/O device error
(6) System SET button

Pressing the system SET button reads the connection status for the S-LINK system and stores it in the memory. In subsequent operation, the S-LINK unit checks for errors using the connection status registered at this time.
The output unit data effective at the time that the system SET button was pressed is retained.

### 4.1 Names and Functions

(7) S-LINK terminal block (6-pin)

The power supply and signal wires of the S-LINK system are connected to the S-LINK terminal block.
The S-LINK terminal block can be detached from the FPO S-LINK control unit for wiring operations.
For detailed information, refer to section "4.3.2 Wiring to S-LINK Terminal Block."
(8) Tool port (RS232C)

The tool port (RS232C) is used to connect a programming tool.
(9) Power supply connector

Supply 24 V DC to the power supply connector. It is connected using the power supply cable (AFP0581) that comes with the unit.
(10) RS232C port

Use this port to connect to devices with an RS232C port, such as an I.O.P., a bar code reader, or an image checker, enabling data input and output.

## Tool port (RS232C) specifications

## Pin assignment

| Pin no. | Abbreviation |
| :---: | :---: |
| 1 | - |
| 2 | SD (TXD) |
| 3 | SG |
| 4 | RD (RXD) |
| 5 | +5 V |

Settings when shipped from the factory

| Default value | Baud rate: 9600bps <br> Character bit: 8bits <br> Parity check: Odd <br> Stop bit: 1bit |
| :--- | :--- |

### 4.2 Specifications

### 4.2.1 General Specifications

| Item | Description |
| :--- | :--- |
| Rated operating voltage | 24 V DC |
| Operating voltage range | 21.6 V to 26.4 V DC |
| Rated current consumption | 150 mA or less |
| Allowed momentary power off time | 10 ms at $21.6 \mathrm{~V}, 10 \mathrm{~ms}$ at 24 V |
| Ambient temperature | $0^{\circ} \mathrm{C}$ to $+55^{\circ} \mathrm{C} / 32^{\circ} \mathrm{F}$ to $+131^{\circ} \mathrm{F}$ |
| Storage temperature | $-20^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C} /-4^{\circ} \mathrm{F}$ to $+158^{\circ} \mathrm{F}$ |
| Ambient humidity | $30 \%$ to $85 \% \mathrm{RH}$ (non-condensing) |
| Storage humidity | $30 \%$ to $85 \% \mathrm{RH}$ (non-condensing) |
| Breakdown voltage | 500 V AC for 1 minute between S-LINK terminal block and power supply/ <br> ground terminals |
| Insulation resistance | min. $100 \mathrm{M} \Omega$ (measured with a 500 V DC megger) <br> between $\mathrm{S}-\mathrm{LINK}$ terminal block and power supply/ground terminals |
| Vibration resistance | 10 Hz to $55 \mathrm{~Hz}, 1$ cycle/min: double amplitude of $0.75 \mathrm{~mm} / 0.030 \mathrm{in} ., 10$ min on <br> 3 axes |
| Shock resistance | Shock of $98 \mathrm{~m} / \mathrm{s}^{2}$ or more, 4 times on 3 axes |
| Noise immunity | $1,000 \mathrm{Vp}-\mathrm{p} \mathrm{with} \mathrm{pulse} \mathrm{widths} 50 \mathrm{~ns}$ and $1 \mu \mathrm{~s}$ (based on in-house measure- <br> ments) |
| Operating condition | Free from corrosive gases and excessive dust |

### 4.2 Specifications

### 4.2.2 S-LINK Controller Specifications

| Item |  | Description |
| :---: | :---: | :---: |
| Rated power supply voltage |  | 24V DC +/-10\% / Allowable ripple p - p +/-10\% max. (Supplied from IN - $24 \mathrm{~V}, \mathrm{IN}-0 \mathrm{~V}$ of the S-LINK terminal block) |
| Current consumption (* note 1) |  | [S-LINK controller current consumption (including D - G line current consumption)] 24V DC 1.6A max. |
|  |  | [Maximum current which can be supplied (supplied to S-LINK unit and I/O devices from 24 V - 0 V line)] + 24V DC 5A (fuse: 5A) |
| Transmission method |  | Bi-directional time-divided multiple signal transmission |
| Synchronization method |  | Bit synchronization, frame synchronization |
| Transmission protocol |  | S-LINK protocol |
| Transmission speed |  | 28.5 kbps |
| Transmission delay time |  | Max. 10.7ms |
| Transmission distance |  | Main signal wire: up to a distance to 200m max. (400m when a booster is used) |
| FAN-out (* note 2) |  | 320 |
| Connection method (* note 3) |  | 'T'-branch multi-drop wiring |
| No. of input/output points |  | 64 points input/64 points output Fixed |
| Display indicators | Transmission display (SEND) | Green LED blinks in response to synchronization signals |
|  | Error indicator | Red LED light up depending on the error |
|  | Error address display | If the system error occurs, the error address is displayed using the red 7-segment LED. |

## Notes

1) For detailed information on current consumption, refer to "Determining the Power Supply" in the " S -LINK Design Manual."
2) The output capacitance for the D-G line of the S-LINK controller and booster is indicated by FAN-out, and the input capacitance from the D-G line of the S-LINK configuration unit is indicated by FAN-in. When configuring the S-LINK system, the configuration should be set up so that the FAN-out total > or = the FAN-in total. (For detailed information on calculating the FAN-in value and other values, see the "S-LINK Design Manual."
3) The FPO S-LINK control unit does not have a loop wiring function.

### 4.3 Wiring the Power Supply

With the FPO S-LINK control unit, power must be supplied at two locations (power supply connector and S-LINK terminal block).

### 4.3.1 Wiring to Power Supply Connector

This is the power supply for the programmable controller section and the S-LINK controller in the S-LINK control unit (24V DC, 150mA).

### 4.3.2 Wiring to S-LINK Terminal Block

This is the power supply for the S-LINK controller in the S-LINK control unit and other S-LINK input/output devices to which power is supplied through the $24 \mathrm{~V}-0 \mathrm{~V}$ line of the S-LINK main cable.
The current consumption for the overall S-LINK system is calculated by referring to the section entitled "Determining the Power Supply" in the "S-LINK Design Manual." (For standard purposes, a power supply exceeding 24 V DC, 1.6 A should be selected.)
Supply of power to S-LINK terminal block

* next page

### 4.3 Wiring the Power Supply

S-LINK terminal block: MC1.5/6-ST-3.5 (Made by Phoenix Contact Co.)

| Terminal name | Color of connecting cable | Description |
| :--- | :--- | :--- |
| 24 V | Brown | Main wire (for S-LINK I/O devices) |
| OV | Blue |  |
| D | White |  |
| G | Black |  |
| IN-24V | - | External power supply input for S-LINK |
| IN-0V | - |  |

Suitable wires (twisted wire)

| Size | AWG\#20 to 16 |
| :--- | :--- |
| Normal cross-section surface area | 0.5 to $1.25 \mathrm{~mm}^{2}$ |

## Notes

- The S-LINK section is protected by a fuse, but if too many input/output devices are connected, or if the current consumption is heavy enough to cause the fuse to blow, we recommend providing a local power supply.
- A short-circuit between D-G, or between D-24V, triggers the protective circuit, but there is no protection against short-circuiting between G-24V or 0V-24V. Be aware that a short-circuit can cause a breakdown or malfunction.

### 4.4 Sequence of Turning on Power Supplies

When turning on the power supplies to the S-LINK control unit, follow the sequence outlined below.

## Procedure:

1. Turn on the power supply to the S-LINK I/O devices connected to the S-LINK system.
2. Turn on the external power supply to the S-LINK.
3. Last, turn on the power supply to the S-LINK control unit itself.

If using the power supply of booster, start up the booster before the external power supply for S-LINK.
When turning off the power supplies, reverse the order of the sequence noted above.
If the power supply of the S-LINK control unit has turned on while the external power supply for the S-LINK is not on, Error 46 (S-LINK communication error) occurs and the unit does not change to the RUN mode.

### 4.5 Operation When Power Supply is Turned On

### 4.5 Operation When Power Supply is Turned On

## Refreshing S-LINK I/O data

With the S-LINK control unit, I/O data is refreshed by the CPUs of both the FPO section and the S-LINK section, through the memory shared between them.

## S-LINK control unit

The illustration below shows the time required until the first refreshing is completed by the S-LINK control unit after the power supply has been turned on. (The external power supply for the S-LINK is already on.)

Power supply of S-LINK control unit turned on

When the power supply to the S-LINK control unit is turned on, it takes approximately 2.6 seconds for the S-LINK I/O data to be verified by the FPO section. Be particularly careful with regard to the FPO sequence program, if using the S-LINK input at the $b$ contact relay when the power supply is turned on.

### 4.6 S-LINK System Address Recognition

### 4.6.1 Recognizing the Address

Before the S-LINK system is being operated for the first time, turn on the power supply and then press the system SET button.
When the system SET button is pressed, the number of connected devices recognized by S-LINK control unit blinks on the error address display in hexadecimal.

If the actual number of connected devices differs from the number displayed, since an unrecognized S-LINK device exists, check for address overlapping, improper connection, etc..
Subsequently, an error check is carried out based on this status. When an address is recognized, that status is stored in the EEPROM, so it is not necessary to press the system SET button after that point (each time the power supply is turned on).
When the power supply is switched on for the first time after completing the S-LINK system wiring, an arbitrary error display may appear. This does not indicate any abnormal operation. If the system SET button is pressed, this display is erased.
If an error address is displayed during operation, confirm the address, and then turn off the power supply, correct the address at the location where the error occurred, and turn the power supply on again. Check to make sure the error address display has disappeared. (Do not press the system SET button in this case.)
If the system SET button is pressed after an error has occurred and before it is canceled, the error will be canceled. If the cause of the error has not been corrected at that point, however, be aware that the I/O device for that address will be skipped during any subsequent checks.

## Note

If the system SET button is pressed without recovery having been made, that status will be recognized for that address, and any locations where recovery has not been made will not be recognized.

### 4.6 S-LINK System Address Recognition

### 4.6.2 Address Setting of S-LINK I/O Device

Addresses can be set freely, regardless of the position of the I/O device connected to the system, but problems in the wiring of the main cable, such as broken or disconnected wires, can be detected more easily if I/O devices closer to the S-LINK control unit are given smaller addresses, and addresses increase in sequential order for I/O devices which are farther away from the S-LINK control unit.

Up to two I/O devices can be assigned the same address within the system for any individual S-LINK control unit. Do not set the same address for three or more I/O devices.
Up to seven boosters can be connected to one system for any individual S-LINK control unit, but the actual number which can be connected varies depending on the units configuring the system and the wiring length.

## Note

The FPO S-LINK control unit does not have a loop wiring function.

### 4.7 Judging Errors from the Error Indicators

If an error occurs in the S-LINK system, the ERROR indicator indicated in the table below lights, depending on the content of the error.

| ERROR indicators |  |  | Description | Steps to take |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| ERR1 | ERR2 | ERR3 | ERR4 |  |  |
| on | off | on | off | Short-circuit between D-G <br> ron note 1 | If the ERR1 or ERR3 indicator lights, output of <br> the signal being transmitted stops, and none <br> of the S-LINK devices connected to the sys- <br> tem will operate. <br> Also, if a short-circuit occurs at a location far <br> away, there may be times when ERR1 does <br> not light. <br> Check the S-LINK signal/power line. |
| off | off | on | off | Error in level of signal being <br> transmitted | There is a possibility that the wiring length, the <br> configuration, or the number of configuration <br> devices connected to the system exceeds the |
| rated limit. Check the system configuration |  |  |  |  |  |
| once again. |  |  |  |  |  |$|$| off |
| :--- |
| off |

Notes

1) This ERROR indicator lights even if the external power supply to the S-LINK has not been turned on, but this does not indicate a breakdown in the S-LINK control unit itself. Check the external power supply to the S-LINK.
2) ERR4 is held, so to cancel it, one of the following is required: turn the power supply to the FPO off and then on again, press the system SET button and enter the settings again, or turn the power supply on the S-LINK side off and then on again.

### 4.8 Judging Errors Address Displays

### 4.8 Judging Errors Address Displays

The transmission line is monitored at all times, and if an error occurs, the address at which the error occurred is displayed as a hexadecimal value.

During normal transmission:
The"ココ" shaped charactor rotates in the clockwise direction.

If an error occurs:
The address is displayed. In case faults occur at several locations, the smallest error address is displayed and the decimal points light up simultaneously.

S-LINK
control unit

Decimal points light up

## Chapter 5

## I/O Allocation

5.1 I/O Number ..... 5-3
5.2 Control Unit ..... 5-4
5.3 Expansion I/O Unit ..... 5-5

### 5.1 I/O Number

## Expression of numbers for input/output relays

Since input relay $(X)$ and output relay $(Y)$ are handled in units of 16 points, they are expressed as a combination of decimal and hexadecimal numbers as shown below.
<Example> External input relay (X)

## Specifying $X$ and $Y$ numbers

On the FPO, the same numbers are used for input and output.
Example: The same number "X20 and Y20" can be used for input and output

### 5.2 Control Unit

### 5.2 Control Unit

The I/O allocation of the FPO control unit is fixed.

| Type |  | I/O number |
| :--- | :--- | :--- |
| C10RS, C10CRS, C10RM, C10CRM | Input: 6 points | X 0 to X 5 |
|  | Output: $\mathbf{4}$ points | Y 0 to Y3 |
| C14RS, C14CRS, C14RM, C14CRM | Input: 8 points | X 0 to X 7 |
|  | Output: $\mathbf{6}$ points | Y 0 to Y5 |
| C16T, C16CT, C16P, C16CP | Input: $\mathbf{8}$ points | X 0 to X 7 |
|  | Output: $\mathbf{8}$ points | Y 0 to Y7 |
| C32T, C32CT, C32P, C32CP , T32CT, T32CP | Input: $\mathbf{1 6}$ points | X 0 to XF |
|  | Output: $\mathbf{1 6}$ points | Y 0 to YF |

## S-LINK Control Unit

The I/O allocation of the S-LINK control unit is fixed.

| Unit | FP0 I/O | S-LINK address |
| :--- | :--- | :--- |
| Input: $\mathbf{6 4}$ points | X 80 to $\mathrm{X8F}$ | 0 to 15 |
|  | X 90 to $\mathrm{X9F}$ | 16 to 31 |
|  | X 100 to X10F | 32 to 47 |
|  | X 110 to X11F | 48 to 63 |
| Output: $\mathbf{6 4}$ points | Y 80 to Y8F | 64 to 79 |
|  | Y90 to Y9F | 80 to 95 |
|  | Y100 to Y10F | 96 to 111 |
|  | Y110 to Y11F | 112 to 127 |

### 5.3 Expansion I/O Unit

Up to three expansion I/O units can be added. I/O numbers do not need to be set as I/O allocation is performed automatically by the FPO control unit when an expansion I/O unit is added.

The I/O allocation of expansion I/O unit is determined by the installation location.

| Type |  | I/O number |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | First expansion | Second expansion | Third expansion |
| E8RS/E8RM | Input: 4 points | X20 to X23 | X40 to X43 | X60 to X63 |
|  | Output: 4 points | Y20 to Y23 | Y40 to Y43 | Y60 to Y63 |
| E8X | Input: 8 points | X20 to X27 | X40 to X47 | X60 to X67 |
| E8YT/E8YP | Output: 8 points | Y20 to Y27 | Y40 to Y47 | Y60 to Y67 |
| E16RS/E16RM/ E16T/E16P | Input: 8 points | X20 to X27 | X40 to X47 | X60 to X67 |
|  | Output: 8 points | Y20 to Y27 | Y40 to Y47 | Y60 to Y67 |
| E16X | Input: 16 points | X20 to X2F | X40 to X4F | X60 to X6F |
| E16YT/E16YP | Output: 16 points | Y20 to Y2F | Y40 to Y4F | Y60 to Y6F |
| E32T/E32P | Input: 16 points | X20 to X2F | X40 to X4F | X60 to X6F |
|  | Output: 16 points | Y20 to Y2F | Y40 to Y4F | Y60 to Y6F |
| A21 | Input channel 0: 16 points | WX2 (X20 to X2F) | WX4 (X40 to X4F) | WX6 (X60 to X6F) |
|  | Input channel 1: 16 points | WX3 (X30 to X3F) | WX5 (X50 to X5F) | WX7 (X70 to X7F) |
|  | Output: 16 points | WY2 (Y20 to Y2F) | WY4 (Y40 to Y4F) | WY6 (Y60 to Y6F) |
| A80, TC4, TC8 | Input CHO, 2, 4, 6: 16 points | WX2 (X20 to X2F) | WX4 (X40 to X4F) | WX6 (X60 to X6F) |
|  | Input CH1, 3, 5, 7: 16 points | WX3 (X30 to X3F) | WX5 (X50 to X5F) | WX7 (X70 to X7F) |
| A04V, A04I | Input: 16 points | WX2 (X20 to X2F) | WX4 (X40 to X4F) | WX6 (X60 to X6F) |
|  | Output CH0, 2: 16 points | WY2 (Y20 to Y2F) | WY4 (Y40 to Y4F) | WY6 (Y60 to Y6F) |
|  | Output CH1, 3: 16 points | WY3 (Y30 to Y3F) | WY5 (Y50 to Y5F) | WY7 (Y70 to Y7F) |
| IOL | Input: 32 points | X20 to X3F | X40 to X5F | X60 to X7F |
|  | Output: 32 points | Y20 to Y3F | Y40 to Y5F | Y60 to Y7F |
| RTD6 | Input CHO, 2, 4: 16 points | WX2 (X20 to X2F) | WX4 (X40 to X4F) | WX6 (X60 to X6F) |
|  | Input CH1, 3, 5: 16 points | WX3 (X30 to X3F) | WX5 (X50 to X5F) | WX7 (X70 to X7F) |
|  | Output: 16 points | WY2 (Y20 to Y2F) | WY4 (Y40 to Y4F) | WY6 (Y60 to Y6F) |

- The channel data of FPO-A80, TC4, TC8, A04V and A04I will switch and be read or written by a user program that contains the conversion data switch flag.
- Please verify with the manual for the FPO CC-Link Slave unit.

### 5.3 Expansion I/O Unit

## Chapter 6

## Installation

6.1 Adding Expansion Units ..... 6-3
6.2 Important Notes ..... 6-5
6.3 Attachment to DIN Rails ..... 6-8
6.4 Installation Using FPO Slim Type Mounting Plate ..... 6-9
6.5 Installation Using FPO Flat Type Mounting Plate ..... 6-10

### 6.1 Adding Expansion Units

## Expansion method

1. Peel the seal on the side of the unit so that the internal connector is exposed.

## Notes

- When peeling the seal on the side of the initial lot products, the shaded part is exposed. Cut off the shaded part with a pair of nippers or similar tool so that the internal connector is exposed.

- When removing the shaded part, use a sharp cutting object, making sure that the shaded part is removed leaving a smooth surface. Note that failure to remove the shaded part completely can result in damage to the connector.
* next page

### 6.1 Adding Expansion Units

2. Raise the expansion hooks on the top and bottom sides of the unit with a screwdriver.

3. Align the pins and holes in the four corners of the control unit and expansion unit, and insert the pins into the holes so that there is no gap between the units.

4. Press down the expansion hooks raised in step 2 to secure the unit.

### 6.2 Important Notes

Please, read the following notes carefully before the installation of your FPO.

Operating environment
(Use the unit within the range of the general specifications when installing)

- Ambient temperatures: 0 to $+55^{\circ} \mathrm{C}$
- Ambient humidity: $\mathbf{3 0 \%}$ to $\mathbf{8 5 \%}$ RH (at $\mathbf{2 5}^{\circ} \mathrm{C}$, non-condensing)
- For use in pollution Degree 2 environment.
- Do not use it in the following environments.
- Direct sunlight
- Sudden temperature changes causing condensation.
- Inflammable or corrosive gas.
- E-xcessive airborne dust, metal particles or saline matter.
- Benzine, paint thinner, alcohol or other organic solvents or strong alkaline solutions such as mmonia or caustic soda.
- Direct vibration, shock or direct drop of water.
- Influence from power transmission lines, high voltage equipment, power cables, power equipment, radio transmitters, or any other equipment that would generate high switching surges. (Min.100mm or less)

## Static electricity

- Before touching the unit, always touch a grounded piece of metal in order to discharge static electricity.
- In dry locations, excessive static electricity can cause problems.

## - Measures regarding heat discharge

- Always install the unit orientated with the tool port facing outward on the bottom in order to prevent the generation of heat.

- Do not install the FPO control unit as shown below.

I/O connectors or I/O terminals on top

Upside-down

Installation which blocks the air duct

Installations such that the I/O connectors or I/O terminals face down

Horizontal installation of the unit

- Do not install the unit above devices which generate heat such as heaters, transformers or large scale resistors.

ज next page

- Installation space
- Leave at least $50 \mathrm{~mm} / 1.97 \mathrm{in}$. of space between the wiring ducts of the unit and other devices to allow heat radiation and unit replacement.

- Maintain a minimum of 100 mm/3.937 in. between devices to avoid adverse affects from noise and heat when installing a device or panel door to the front of the FPO unit.

- Keep the first $100 \mathrm{~mm} / 3.937$ in. from the front surface of the FPO control unit open in order to allow room for programming tool connections and wiring.

### 6.3 Attachment to DIN Rails

### 6.3 Attachment to DIN Rails

The FPO unit enables one-touch attachment to DIN rails.

## Procedure:

1. Fit the upper hook of the FPO unit onto the DIN rail.
2. Without moving the upper hook, press on the lower hook to fit the FPO unit into position.

You can easily remove the FPO unit as described below.

## Procedure:

1. Insert a slotted screwdriver into the DIN rail attachment lever.
2. Pull the attachment lever downwards.
3. Lift up the FPO unit and remove it from the rail.

### 6.4 Installation Using FP0 Slim Type Mounting Plate

Use M4 size pan-head screws for attachment of FPO slim type mounting plate (AFP0803) to mounting panel. For a diagram showing detailed dimensions of the FPO slim type mounting plate, see *section 13.4.

## Procedure:

1. Fit the upper hook of the FPO unit onto the FPO slim type mounting plate.
2. Without moving the upper hook, press on the lower hook to fit the FPO unit into position.

When using an expansion unit, tighten the screws after joining all of the FPO slim type mounting plate to be connected. Tighten the screws at each of the four corners.
Example: Two expansion units
 (unit: mm/in.)

### 6.5 Installation Using FPO Flat Type Mounting Plate

Use M4 size pan-head screws for attachment of FPO flat type mounting plate (AFP0804) and install according to the dimensions shown below.

For a diagram showing detailed dimensions of the FPO flat type mounting plate, see *section 13.5.

## Procedure:

1. Raise the expansion hooks on the top and bottom of the unit.
2. Install the FPO unit on the FPO flat type mounting plate.
3. Align the expansion hooks with the plate and press the hooks back down.

- The FPO flat type mounting plate (AFP0804) cannot be used for an expansion unit.
* next page
- An FPO unit with an attached FPO flat type mounting plate can also be installed sideways on a DIN rail.

### 6.5 Installation Using FPO Flat Type Mounting Plate

7.9 Wiring the RS232C Port ..... 7-20

### 7.1 Safety Instructions

In certain applications, malfunction may occur for the following reasons:

- Power ON timing differences between the FPO control unit and I/O or motorized devices
- An operation time lag when a momentary power drop occurs
- Abnormality in the FPO unit, power supply circuit, or other devices

In order to prevent a malfunction resulting in system shutdown choose the adequate safety circuits or other safety measures listed in the following:

### 7.1.1 Interlock Circuit

When a motor clockwise/counter-clockwise operation is controlled, provide an interlock circuit that prevents clockwise and counter-clockwise signals from inputting into the motor at the same time.

### 7.1.2 Emergency Stop Circuit

Add an emergency stop circuit to controlled devices in order to prevent a system shutdown or an irreparable accident when malfunction occurs.

### 7.1.3 Start Up Sequence

The FP0 should be operated after all of the outside devices are energized. To keep this sequence, the following measures are recommended:

- Set the mode switch from PROG. mode to RUN mode after power is supplied to all of the outside devices
- Program the FPO so as to disregard the inputs and outputs until the outside devices are energized

## Note

When stopping the operation of FPO also, have the I/O devices turned OFF after the FPO has stopped operating.

### 7.1 Safety Instructions

### 7.1.4 Momentary Power Failures

If the duration of the power failure is less than 5 ms , the FPO continues to operate. If the power is OFF for 5 ms or longer, operation changes depending on the combination of units, the power supply voltage, and other factors. (In some cases, operation may be the same as that for a power supply reset.)
If operation is to be continued following recovery from the momentary power failure, use an automatic retaining sequence program that uses a hold type internal relay.

### 7.1.5 Protecting Power Supply and Output Sections

An insulated power supply with an internal protective circuit should be used. The power supply for the control unit operation is a non-insulated circuit, so if an incorrect voltage is directly applied, the internal circuit may be damaged or destroyed. If using a power supply without a protective circuit, power should be supplied through a protective element such as a fuse.
If current exceeding the rated control capacity is being supplied in the form of a motor lock current or a coil shorting in an electromagnetic device, a protective element such as a fuse should be attached externally.

### 7.2 Wiring the Power Supply to the Control Unit

Use the power supply cable (AFP0581) that comes with the unit to connect the power supply.

| Item | Descriptions |
| :--- | :--- |
| Rated voltage | 24 V DC |
| Operating voltage range | 21.6 to 26.4 V DC |

- To minimize adverse effects from noise, twist the brown and blue wires of the power supply cable.
- To protect the system against erroneous voltage from the power supply line, use an insulated power supply with an internal protective circuit.
- The regulator on the FPO unit is a non-insulated type.
- If using a power supply device without an internal protective circuit, always make sure power is supplied to the unit through a protective element such as a fuse.
* next page
- Isolate the wiring systems to the FPO, input/output devices, and motor devices.

Circuit breaker

- The power supply sequence should be set up so that power to the control unit is turned OFF before the input/output power supplies.
- If the input/output power supplies are turned OFF before the power to the control unit, the FPO control unit may detect a drop in the input level, and malfunction.
- Be sure to supply power to a control unit and an expansion unit from the same power supply, and turn the power ON and OFF simultaneously for both.

### 7.3 Grounding

Under normal conditions, the inherent noise resistance is sufficient. However, in situations of excess noise, ground the instrument to increase noise suppression.
For grounding purposes, use wiring with a minimum of $2 \mathbf{m m}^{2}$. The grounding connection should have a resistance of less than $100 \Omega$.

CORRECT

Notes

- The point of grounding should be as close to the FPO control unit as possible. The ground wire should be as short as possible.
- If two devices share a single ground point, it may produce an adverse effect. Always use an exclusive ground for each device.
- Depending on the surroundings in which the equipment is used, grounding may cause problems.
<Example>
Since the power supply line ( 24 VDC and GND terminal) of the FPO power supply connector is connected to the frame ground (F.G.) through a varistor, if there is an irregular potential between the power supply line ( 24 VDC and GND) and earth, the varistor may be shorted.

### 7.3 Grounding

## When the plus side is grounded, do not ground the functional earth terminal.

Do not ground the FPO functional earth terminal if the plus terminal of the power supply is grounded.
Depending on the PC, some types have the SG terminal of the RS232C port connected to the outside structure of the connector. Also, the outside structure of the FPO tool port is connected to the functional earth terminal. For this reason, connecting a PC will connect the FPO GND terminal to the functional earth terminal. In particular, because a voltage of -24 V will be applied to the GND terminal when the plus terminal is grounded, a potentially damaging short circuit will occur when, in this state, the GND terminal and functional earth are connected.

### 7.4 Input Wiring

## Notes

- Be sure to select the thickness (dia.) of the input wires while taking into consideration the required current capacity.
- Arrange the wiring so that the input and output wiring are separated, and so that the input wiring is separated from the power wiring, as much as possible. Do not route them through the same duct or wrap them up together.
- Separate the input wires from the power and high voltage wires by at least $100 \mathrm{~mm} / 3.937 \mathrm{in}$.
In this section you find some examples for wiring sensors, an LED-equipped reed switch, a two-wire type sensor and a LED-equipped limit switch.

### 7.4.1 Sensors

Relay output type

Universal output type

PNP open collector output type

NPN open collector output type

Two-wire type (* next page)

### 7.4.2 LED-Equipped Reed Switch

When a LED is connected to an input contact such as LED-equipped reed switch, make sure that the ON voltage applied to the FPO input circuit is greater than 19.2 V DC. In particular, take care when connecting a number of switches in series.

### 7.4.3 Two-Wire Type Sensor

If the input of the FPO does not turn OFF because of leakage current from the two-wire type sensor, the use of a bleeder resistor is recommended, as shown below.

I: Sensor's leakage current (mA)
R: Bleeder resistor ( $k \Omega$ )
The OFF voltage of the FPO input is 2.4 V , therefore, select an R value so that the voltage between the COM terminal and the input terminal will be less than 2.4 V .
(The impedance of the FPO input terminal is $5.6 \mathrm{k} \Omega$.)
The resistance R of the bleeder resistor is: $\mathrm{R}<$ or $=\frac{13.44}{5.6 \times \mathrm{I}-2.4} \quad(\mathrm{k} \Omega)$
The wattage W of the resistor is:

$$
W=\frac{(\text { Power supply voltage })^{2}}{R}
$$

In the actual selection, use a value that is 3 to 5 times the value of W .

### 7.4.4 LED-Equipped Limit Switch

If the input of the FPO does not turn OFF because of the leakage current from the LED-equipped limit switch, the use of a bleeder resistor is recommended, as shown below.

r: Internal resistor of limit switch ( $k \Omega$ )
R: Bleeder resistor ( $k \Omega$ )
The OFF voltage of the FPO input is 2.4 V , therefore when the power supply voltage is 24 V , select R so that
the current will be greater than $I=\frac{24-2.4}{r}$
The resistance $R$ of the bleeder resistor is: $R<$ or $=\frac{13.44}{5.6 \times I-2.4}(\mathrm{k} \Omega)$
The wattage W of the resistor is: $\mathrm{W}=\frac{\left(\text { Power supply voltage) }{ }^{2}\right.}{\mathrm{R}}$
In the actual selection, use a value that is 3 to 5 times the value of W .

### 7.5 Output Wiring

## Notes

- There is no fuse protection built into the output circuit. Therefore, in order to protect against overheating of the output circuitry caused by possible short circuits, install an external fuse at each point. However, in cases such as short circuits, the control unit itself may not be protected.
- Be sure to select the thickness (dia.) of the output wires while taking into consideration the required current capacity.
- Arrange the wiring so that the input and output wiring are separated, and so that the output wiring is separated from the power wiring, as much as possible. Do not route them through the same duct or wrap them up together.
- Separate the output wires from the power and high voltage wires by at least $100 \mathrm{~mm} / 3.937 \mathrm{in}$.
Protect the outputs as described below:

### 7.5.1 Protective Circuit for Inductive Loads

With an inductive load, a protective circuit should be installed in parallel with the load. When switching DC inductive loads with FPO relay output type, be sure to connect a diode across the ends of the load.
When using an AC inductive load

* next page

7-12

## When using a DC inductive load

(*) Diode:
Reverse voltage $\left(\mathrm{V}_{\mathrm{R}}\right)$ : 3 times the load voltage
Average rectified forward current (10): Load current or more _

### 7.5.2 Precautions for Using Capacitive Loads

When connecting loads with large in-rush currents, to minimize their effect, connect a protection circuit as shown below.

### 7.6 Wiring the Terminal Type

### 7.6 Wiring the Terminal Type

A screw-down connection type terminal block socket for terminal of FPO control unit and analog I/O unit is used. The terminal block socket and suitable wires are given below.

## Terminal block socket

| Item | Description |
| :--- | :--- |
| Manufacturer | Phoenix Contact Co. |
| Model | MC1,5/9-ST-3,5 |
| Product number | 1840434 |

## Suitable wires (twisted wire)

| Item | Description |
| :--- | :--- |
| Control unit | Size: AWG \#24 to 16 |
|  | Conductor cross-sectional area: 0.3 to $1.25 \mathrm{~mm}^{2}$ |
| Analog I/O unit | Size: AWG \#28 to 16 |
|  | Conductor cross-sectional area: 0.08 to $1.25 \mathrm{~mm}^{2}$ |

## Pole terminal with a compatible insulation sleeve

If a pole terminal is being used, the following models are marketed by Phoenix Contact Co.

| Manufacturer | Cross-sectional <br> area $\left(\mathbf{m m}^{2}\right.$ ) | Size | Product number |
| :--- | :--- | :--- | :--- |
| Phoenix Contact Co. | 0.25 | AWG \#24 | Al 0,25-6YE |
|  | 0.50 | AWG \#20 | Al 0,5-6WH |
|  | 0.75 | AWG \#18 | Al 0,75-6GY |
|  | 1.00 | AWG \#18 | Al 1-6RD |

## Pressure welding tool for pole terminals

| Manufacturer | Phoenix Contact Co. |
| :--- | :--- |
| Type | CRIMPFOX UD6 |
| Product number | 1204436 |

When tightening the terminals of the terminal block socket, use a screwdriver (Phoenix Contact Co., Product no. 1205037) with a blade size of $0.4 \times 2.5$. The tightening torque should be 0.22 to $0.25 \mathrm{~N} \cdot \mathrm{~m}(2.3$ to $2.5 \mathrm{kgf} \cdot \mathrm{cm}$ ) or less.

## Procedure:

1. Remove a portion of the wire's insulation.

2. Insert the wire into the terminal block socket until it contacts the back of the block socket, and then tighten the screw clockwise to fix the wire in place.

## Notes

- When removing the wire's insulation, be careful not to scratch the core wire.
- Do not twist the wires to connect them.
- Do not solder the wires to connect them. The solder may break due to vibration.
- After wiring, make sure stress is not applied to the wire.
- In the terminal block socket construction, if the wire closes upon counter-clockwise rotation, the connection is faulty. Disconnect the wire, check the terminal hole, and then re-connect the wire.

### 7.7 Wiring the MOLEX Connector Type

### 7.7 Wiring the MOLEX Connector Type

The housings and contacts listed below come supplied with the FPO. Use the wires given below. Also, use the required special tool for connecting the wires.

## Supplied connector

| Manufacturer | Item | Product number |
| :--- | :--- | :--- |
| Molex Co., Ltd. | Housing | $51067-0900(2$ pieces $)$ |
|  | Contact | $50217-8100(20$ pieces $)$ |

## Suitable wires (twisted wire)

- Size: AWG \#24 to 18
- Conductor cross-sectional area: 0.2 to $0.75 \mathrm{~mm}^{2}$
- Insulation outside diameter: dia. 1.4 to dia. 3.0

## Special crimping tool

- Manufacturer: Molex Japan Co., Ltd
- Product number: 57189-5000

## Procedure:

## 1. Remove a portion of the wire's insulation.

3 to $3.5 \mathrm{~mm} / 0.118$ to 0.138 in .
ज next page
2. Place the contact in the crimping tool, place the wire in the contact and lightly squeeze the tool.

3. Insert the crimped wire into the housing until it contacts the back side.

## Note

When removing a wire, use a flat-head screwdriver, or other similar tool, to pull up the hold-down pin of the housing and then pull out the wire.

### 7.8 Wiring the MIL Connector Type

The housings, semi-cover and pressure welders listed below come supplied with the FPO. Use the wires given below. Also, use the required pressure connection tools for connecting the wires.

## Supplied connector

| Manufacturer | Item |
| :--- | :--- |
| Panasonic Electric <br> Works SUNX Co., Ltd. | Housing (10P) |
|  | Semi-cover (10P) |
|  | Contact (5 pin) |

## Suitable wires (twisted wire)

| Size | Conductor cross-sectional area | Insulation thickness | Rated current |
| :--- | :--- | :--- | :--- |
| AWG \#22 | $0.3 \mathrm{~mm}^{2}$ | dia. 1.5 to dia. 1.1 | 3 A |
| AWG \#24 | $0.2 \mathrm{~mm}^{2}$ | (ial |  |

## Pressure connection tool

- Order number: AXY52000FP

## Procedure:

The wire end can be directly crimped without removing the wire's insulation, saving labor.

1. Bend the welder (contact) back from the carrier, and set it in the pressure connection tool.

2. Insert the wire without removing its insulation until it stops, and lightly grip the tool.

* next page

3. After press-fitting the wire, insert it into the housing.

4. When all wires has been inserted, fit the semi-cover into place.

## Note

If using a MIL connector for flat cables, please specify the order number AFP0808.

### 7.8.1 Contact Puller Pin for Rewiring

If there is a wiring mistake or the cable is incorrectly pressure-connected, the contact puller pin provided with the fitting can be used to remove the contact.

Press the housing against the pressure connection tool so that the contact puller pin comes in contact with this section.

### 7.9 Wiring the RS232C Port

### 7.9 Wiring the RS232C Port

When using the RS232C port, use the screw-down connection type terminal and the wire according to the following procedures.

FP0 Control unit with RS232C port
(FP0 C10CRM/C10CRS/C14CRM/C14CRS/C16CT/C16CP/C32CT/C32CP)

| Item | Specification |
| :--- | :--- |
| Baud rate | $300 / 600 / 1200 / 2400 / 4800 /$ <br> $9600 / 19200 \mathrm{bps}$ |
| Transmission <br> distance | $3 \mathrm{~m} / 9.84 \mathrm{ft}$. |
| Terminal block | Made by Phoenix Contact <br> Co. (3-pin) <br> Product number: MKDS <br> $1 / 3-3.5$ |
| Communication <br> method | half-duplex |

## Settings when shipped from the factory

These are changed using system registers 412 to 414 . The settings in effect when the unit is shipped from the factory are noted below.

| 412 | RS232C port is not used. |
| :--- | :--- |
| 413 | Character bit: 8 bits <br> Parity check: odd <br> Stop bit: 1 bit <br> Header: without STX code <br> Terminator: CR |
| 414 | Baud rate: 9600 bps |

## Suitable wires (twisted wire)

- Size: AWG \#28 to 16
- Conductor cross-sectional area: 0.08 to $1.25 \mathrm{~mm}^{2}$

Use a shielded wire of the above wiring. We recommend grounding the shield section. Also, if using a pole terminal, see * section 7.6.

When tightening the RS232C port, use a screwdriver (Phoenix Contact Co., Product no. 1205037) with a blade size of $0.4 \times 2.5$. The tightening torque should be 0.22 to 0.25 $\mathrm{N} \cdot \mathrm{m}$ (2.3 to $2.5 \mathrm{kgf} \cdot \mathrm{cm}$ ) or less.

## Procedure:

## 1. Remove a portion of the wire's insulation.

2. Insert wire into the RS232C port until it contacts the back of the RS232C port.

3. Tighten the screw clockwise to fix the wire in place.

- When removing the wire's insulation, be careful not to scratch the core wire.
- Do not twist the wires to connect them.
- Do not solder the wires to connect them. The solder may break due to vibration.
- After wiring, make sure stress is not applied to the wire.
- In the RS232C port terminal construction, if the wire closes upon counter-clockwise rotation, the connection is faulty. Disconnect the wire, check the terminal hole, and then re-connect the wire.

### 8.1 Use of Duplicated Output

### 8.1.1 Duplicated Output

Duplicated output refers to repeatedly specifying the same output in a program.
If the same output is specified for the "OT" and "KP" instructions, it is considered to be duplicated output.
Even if the same output is used for multiple instructions, such as the SET or RST instruction, or high-level instruction for data transfer, it is not regarded as duplicated output.

If you enter RUN mode while the duplicated output condition exists, under normal conditions, it will be flagged as an error, the ERROR/ALARM LED will light and the self-diagnostic error flag R9000 will go on.

## How to Check for Duplicated Use

You can check for duplicated outputs in the program using the programming tool, by the following method:

## Using FP Programmer II:

Operate the TOTAL CHECK function.
Key operation: $\left.\begin{array}{c}(-) \\ \mathrm{OP}\end{array}\right) 9 \begin{gathered}\text { ENT } \\ \mathrm{READ}\end{gathered}$
If there are any duplicated outputs, an error message (DUP USE) and the address will be displayed.
Using FPWIN GR software:
Execute the "Debug" on "Totally Check Program."
If there are any duplicated outputs, an error message (DUPLICATED OUTPUT
ERROR) and the address will be displayed. If you execute "SEARCH AN ERROR," the error message will be displayed, and the first address number will be displayed.

## Enabling Duplicated Output

If you need to use output repeatedly due to the content of the program, duplicated output can be enabled.
In this case, change the setting of system register 20 to "enable" (when using FP Programmer II, set K1).
When this is done, an error will not occur when the program is executed.
8.1 Use of Duplicated Output

### 8.1.2 When Output is Repeated with an OT, KP, SET, or RST Instruction

## Condition of Internal and Output Relays During Operation

When instructions are repeatedly used which output to internal and output relays such as transfer instructions and OT, KP, SET and RST instructions, the contents are rewritten at each step during operation.
$\stackrel{y}{c}$
Example: Processing when SET, RST and OT instructions are used (XO to X2 are all on).

The output is determined by the final operation results
If the same output is used by several instructions such as the OT, KP, SET, RST, or data transfer instructions, the output obtained at the I/O update is determined by the results of the operation at the greatest program address.

Example: Output to the same output relay YO with OT, SET and RST instructions.

When X 0 to X 2 are all on, Y 0 is output as off at $\mathrm{I} / \mathrm{O}$ update.
If you need to output a result while processing is still in progress, use a partial I/O update instruction "F143 (IORF)".

### 8.2 Handling BCD Data

### 8.2.1 BCD Data

$B C D$ is an acronym for binary-coded decimal, and means that each digit of a decimal number is expressed as a binary number.

## Example:

Expressing a decimal number in BCD:

| Decimal number | $\mathbf{6}$ | $\mathbf{4}$ | $\mathbf{5}$ |
| :--- | :---: | :---: | :---: |
| Each digit is converted |  |  |  |
| BCD <br> to a binary number. |  |  |  |
| (Binary-coded <br> decimal) | 0110 | 0100 | 0101 |

### 8.2.2 Handling BCD Data in the PLC

When inputting data from a digital switch to the PLC or outputting data to a 7-segment display (with a decoder), the data must be in BCD form. In this case, use a data conversion instruction as shown in the examples at below.
BCD arithmetic instructions "F40 (B+) to F58 (DB-1)" also exist which allow direct operation on BCD data, however, it is normally most convenient to use BIN operation instructions "F20 (+) to F38(D-1)" as operation in the PLC takes place in binary.

## Input From a Digital Switch

Use the BCD-to-BIN conversion instruction "F81 (BIN)".

### 8.2 Handling BCD Data

## Output to a 7-segment Display (with Decoder)

Use the BIN-to-BCD conversion instruction "F80 (BCD)".

Data processed in PLC (BIN data)

Data outputted from PLC (BCD data)

### 8.3 Handling Index Registers

### 8.3.1 Index Registers

Like other registers, index registers have two points, IX and IY, for reading and writing 16-bit data.
Use an index register to indirectly specify a memory area number. (This is also called index modification.)

## Example:

Transferring the contents of data register DT100 to the number specified by the contents of an index register.

In this example, the number of the destination data register varies depending on the contents of IX with DTO acting as a base. For example, when IX contains K10 the destination will be DT10, and when IX is K20, the destination will be DT20.
In this way, index registers allow the specification of multiple memory areas with a single instruction, and thus index registers are very convenient when handling large amounts of data.

### 8.3.2 Memory Areas Which can be Modified with Index Registers

Index registers can be used to modify other types of memory areas in addition to data registers DT.
IXWXO, IXWY1, IXWR0, IXSV0, IXEV2, IXDT100
Constants can also be modified.
IXK10, IXH1001
An index register cannot modify another index register.
IXIX, IXIY
When using index modification with an instruction which handles 32-bit data, specify with IX. In this case, IX and IY are handled together as 32-bit data.

### 8.3 Handling Index Registers

### 8.3.3 Example of Using an Index Register

## Repeatedly Reading in External Data

Example:
Writing the contents of word external input relay WX3 to a sequence of data registers beginning from DTO.

(1) When R0 turns on, K0 is written to index register IX.
(2) When the R1 turns on, the contents of WX3 is transferred to the data register specified by IXDT0.
(3) Add 1 to IX.

In this case, the contents of IX will change successively, and the destination data register will be as follows.

| Input times <br> of R1 | Contents of <br> IX | Destination <br> data register |
| :--- | :--- | :--- |
| 1st | 0 | DT0 |
| 2nd | 1 | DT1 |
| 3rd | 2 | DT2 |
| $:$ | $:$ | $:$ |

## Inputting and Outputting Data Based on a Number Specified by an Input

$\stackrel{y}{c}$
Example 1: Setting a timer number specified by a digital switch

(1) Convert the BCD timer number data in WX1 to binary and set it in index register IX.
(2) Convert the BCD timer set value in WXO to binary and stored in the timer set value area SV specified by contents of IX.

Example 2: External output of the elapsed value in a timer number specified by a digital switch

(1) Convert the BCD timer number data in WX1 to binary, and set it in index register IX.
(2) Convert the elapsed value data EV in the timer specified by IX to BCD, and output it to word external output relay WYO.

### 8.4 Operation Errors

### 8.4.1 Outline of Operation Errors

An operation error is a condition in which operation is impossible when a high-level instruction is executed.

When an operation error occurs, the ERROR/ALARM LED on the FPO control unit will blink and the operation error flags (R9007 and R9008) will turn on.
The operation error code "E45" is set at special data register DT9000.
The error address is stored in special data registers DT9017 and DT9018.

## Types of Operation Error

## Address error

The memory address (number) specified by index modification is outside the area which can be used

## BCD data error

Operation is attempted on non-BCD data when an instruction handling BCD is executed, or BCD conversion is attempted on data which is not within the possible conversion range.

## Parameter error

In an instruction requiring the specification of control data, the specified data is outside the possible range.

## Over area error

The data manipulated by a block instruction exceeds the memory range.

### 8.4.2 Operation Mode When an Operation Error Occurs

Normally, the operation stops when an operation error occurs.
However, when you set system register 26 to "continuation" (KI), the FPO control unit operates even if an operation error occurs.

### 8.4.3 Dealing with Operation Errors

## Procedure:

## 1. Check the location of the error.

Check the address where the error occurred, which is stored in DT9017 and DT9018, and make sure the high-level instruction for that address is correct and appropriate.

## 2. Clear the error.

Use a programming tool to clear the error. (If the mode selector is set to RUN, RUN will resume as soon as the error is cleared.)
In FP Programmer II, press the following keys.

An error can be cleared by turning the power off and on in PROG. mode, however, the contents of the operation memory except the hold type data will be cleared.
An error can also be cleared by executing a F148 (self-diagnostic error set) instruction.

### 8.4.4 Points to Check in Program

Check if an extraordinarily large value or negative value was stored in the index register.

$\stackrel{y}{c}$
Example: When a data register is modified using an index register
 ] 1

In this case, index register (IX) modifies the address of data register DTO. If data in IX is larger than the last address of the data register, an operation error will occur. If the PLC you are using is of the FPO 16-point type, the last address of the data register is DT1659. If the data in IX exceeds the range of K0 to K255, an operation error will occur. The same is true when the contents of IX are negative.
Is there any data which cannot be converted using $\mathrm{BCD} \leftrightarrow \mathrm{BIN}$ data conversion?
Example: When BCD-to-BIN conversion is attempted
 ]

In this case, if DTO contains a hexadecimal number with one of the digits $A$ through $F$ such as 12A4, conversion will be impossible and an operation error will result.

Example: When BIN-to-BCD conversion is attempted

In this case, if DT1 contains a negative value or a value greater than K9999, an operation error will occur.
Check if the divisor of a division instruction is K0.
$\stackrel{y}{c}$
Example:

In this case, if the content of DT100 is K0, an operation error will occur.

### 8.5 Instruction of Leading Edge Detection Method

### 8.5.1 Instructions of Leading Edge Detection Method

## Instructions Using the Leading Edge Detection Operation

DF (leading edge differential) instructions
Count input for CT instructions
Count input for F118 (UDC) instructions
Shift input for SR instructions
Shift input for F119 (LRSR) instructions
NSTP instructions

## Leading Edge Detection Method

An instruction with a leading edge detection method operates only in the scan where its trigger (execution condition) is detected switching from off to on.

The condition of the previous execution and the condition of the current execution are compared, and the instruction is executed only if the previous condition was off and the current condition is on. In any other case, the instruction is not executed.

### 8.5 Instruction of Leading Edge Detection Method

## Precautions When Using an Instruction Which Performs Leading Edge Detection

When RUN begins, for example when the system is powered on, the off $\rightarrow$ on change of the execution condition (trigger) is not detected. The instruction is not executed. Execution of the instruction will take place as explained on section 8.5.2.
When used with one of the instructions indicated in instructions below which change the order of execution of instructions, the operation of the instruction may change depending on input timing. Take care regarding this point.
Be careful when using leading edge detection type instructions with control instructions, such as:

MC and MCE instructions
JP and LBL instructions
LOOP and LBL instructions
CNDE instruction
Step ladder instructions
Subroutine instructions

### 8.5.2 Operation and Precautions at Run Start Time

## Operation of first scan after RUN begins

The leading edge detection instruction is not executed when the mode has been switched to the RUN mode, or when the power supply is booted in the RUN mode, if the trigger (execution condition) is already on.

If you need to execute an instruction when the trigger (execution condition) is on prior to switching to RUN mode, use R9014 (initial pulse off relay) in your program on the following page. (R9014 is a special internal relay which is off during the first scan and turns on at the second scan.)

## Example 1: DF (leading edge differential) instruction

RUN

Even if X0 was initially on, the input condition (X0) for the DF instruction is off-to-on at the second scan, therefore derivative output is obtained.

## Example 2: CT (counter) instruction

Add R9014

RUN

### 8.5 Instruction of Leading Edge Detection Method

### 8.5.3 Precautions When Using a Control Instruction

Instructions which leading edge detection compare the condition of the previous execution and the condition of the current execution, and execute the instruction only if the previous condition was off and the current condition is on. In any other case, the instruction is not executed.

When a leading edge detection instruction is used with an instruction which changes the order of instruction execution such as MC, MCE, JP or LBL, the operation of the instruction may change as follows depending on input timing. Take care regarding this point.

## E Example 1:

Using the DF instruction between MC and MCE instructions

Time chart 1

## Example 2:

Using the CT instruction between JP and LBL instructions

Time chart 1

Final timing at which the previous JP instruction was not executed

The count is not incremented, because the final timing at which the previous JP instruction was not executed has not been changed, and the execution condition XO for the counter input has not changed.

Time chart 2

### 8.6 Precautions for Programming

### 8.6 Precautions for Programming

## Programs which do not execute correctly

Do not write the following programs as they will not execute correctly.

## Program example 1:

Program in which the example 1 is rewritten

## Program example 2:

## Program example 3:

When a combination of contacts are set as the trigger (execution condition) of a differential instruction (DF) or timer instruction, do not use an AND stack (ANS) instruction, read stack (RDS) instruction, or pop stack (POPS) instruction.

### 8.7 Rewrite Function During RUN

### 8.7.1 Operation of Rewrite During RUN

## How Operation of Rewrite During RUN

The FPO allows program rewriting even in RUN mode. When a rewrite is attempted during RUN, the tool service time is temporarily extended, program rewriting is performed, and operation is resumed without the need to change the mode. For this reason, the time of the scan during the RUN rewrite extends from several msec to several hundreds of msec.

## Operation During Rewrite

External output $(\mathrm{Y})$ is held.
External output $(\mathrm{X})$ is ignored.
The timer ( T ) stops the clock.
Rise and fall changes in the inputs of differential instructions (DF), counter instructions (CT), and left/right shift registers [F119 (LRSR)] are ignored.
Interrupt functions are stopped.
Internal clock relays (special internal relays) are also stopped.
Pulse output is stopped during the rewrite.

## Set Values for Timer/Counter Instructions

All set values specified with decimal constants ( K ) in timer and counter instructions are preset in the corresponding set value areas (SV). Values in the elapsed value area (EV) do not change.

## Operation of Rewrite During RUN Completed Flag

The rewrite during RUN completed flag (R9034) is a special internal relay that goes on for only the first scan following the completion of rewriting in the RUN mode. It can be used instead of the initial pulse relay following a change in the program. (Supported in CPU Ver. 2.0 and subsequent versions)

### 8.7 Rewrite Function During RUN

### 8.7.2 Cases Where Rewriting During Run is not Possible

When the timeout error message is indicated:
Even if the timeout error message is indicated, it is highly possible that the program in PLC has been already rewritten. Carry out the following operations.

## 1. When ladder symbol mode

As a ladder editing is left, set it to the offline edit mode. Complete the program conversion in the tool software, and then change to the online edit mode to check.

## 2. When boolean mode

A ladder editing is cleared.
Set it to the offline edit mode and carry out the editing operation again. After the operation, change to the online edit mode to check.

When the timeout error occurs using the through mode in GT series programmable display.
Extend the timeout time of the programmable display using the GTWIN.
(The default setting is 5 seconds.)

Select "Transfer" from "File" in the menu bar. The "transfer data" screen will open. Select "Condition" to open "Communication Setting" screen. Change the value for "Timeout". Click "OK" button to complete the change of setting.

Instructions which do not allow rewriting during RUN
Step ladder instructions (SSTP/STPE)
Subroutine instructions (SUB/RET)
Interrupt instructions (INT/IRET)
Control instructions (ED/LBL)
(LBL instructions allow insertion and writing, but not deletion and clearing.)

## Instructions which do not allow rewriting to subprograms

The following instructions do not allow rewriting during subroutines or interrupt programs.
Jump/label instructions (JP/LBL)
Loop/label instructions (LOOP/LBL)
Master control relay/master control relay end instructions (MC/MCE)

## Cases where rewriting is not possible during RUN

When a syntax error has occurred.
During forced input/output operation

## Interrupt Restrictions

When using interrupt, high-speed counter, pulse output or PWM output functions, do not perform a rewrite during RUN.
If a rewrite during RUN is executed, the following problems may occur. Exercise caution. Interrupt programs will be disabled. Enable by executing an ICTL instruction once again.

## Example: Using R9034 (rewrite during RUN completed flag)

The high-speed counter will continue to count.
At 2.5 kHz or higher during one-phase, one channel counting or 1.25 Hz or higher during one-phase, two channel counting, miscounts may occur.
Target value match on/off instructions (F166/F167) will continue.
Coincidence programs will be disabled.
Pulse output and PWM output will be stopped. The F168 instruction (positioning control) will continue to operate.
However, when the maximum output frequency is higher than 2.5 kHz during one-phase, one channel counting or 1.25 Hz during one-phase, two channel counting, the output pulse number may differ from the set number.

### 8.7 Rewrite Function During RUN

### 8.7.3 Procedures and Operation of Rewrite During RUN

| Item |  | FPWIN GR <br> Ladder symbol mode | FPWIN GR <br> Boolean mode | FP Programmer II |
| :---: | :---: | :---: | :---: | :---: |
| Rewrite procedure |  | Maximum of 128 steps. <br> Changes are performed by block. <br> When PG conversion is executed online, the program will be rewritten. | Rewriting performed by step. <br> Caution is required as rewriting takes place simultaneously with the change. <br> In the case of FP Programmer II, the mode must be changed. (See section 8.7.4.) |  |
| Operation of each instruction | OT/KP | If an instruction written in block $a$ is deleted in block $b$, the condition before the rewrite will be held. | If an instruction written in block a is deleted in block b , the condition before the rewrite will be held. <br> Y contact relays which are on will be held in the on status. To turn them off in the RUN mode, use forced output. |  |
|  | TM/CT | If an instruction written in block $a$ is deleted in block $b$, the condition before the rewrite will be held. <br> Set values specified by K constants in TM/CT instructions are preset in all of the corresponding SV's in the program. (Elapsed values EV do not change.) | If an instruction written in block a is deleted in block b, the condition before the rewrite will be held. <br> Set values specified by K constants in TM/CT instructions are preset in all of the corresponding SV's in the program. (Elapsed values EV do not change.) <br> In the case of FP Programmer II, set values can be rewritten during operation without affecting the timer. For detailed information section 8.8 |  |
|  | High-level instructions | If an instruction written in block $a$ is deleted in block $b$, the condition before the rewrite will be held. | If deleted, the output memory area will be held. |  |
|  | MC/MCE | When writing MC/MCE instructions, be sure to write the instructions as a pair. | Writing or deleting a single instruction during RUN is not possible. Write or delete the instruction in FPWIN GR ladder symbol mode. |  |
|  | CALL/SUB/ RET | A subroutine is a program appearing between SUBn and RET instructions. Be sure to write it to an address which follows the ED instruction. | Write in the order: RET, SUB, CALL Delete in the order: CALL, SUB, RET |  |
|  | INT/IRET | An interrupt program is a program appearing between INTn and IRET instructions. Be sure to write it to an address which follows the ED instruction. | Write in the order: IRET, INT Delete in the order:INT, IRET |  |

### 8.7.4 Changing Modes in FP Programmer II

## Changing program modes

FP Programmer II is normally in PROG-EDIT mode which does not allow unintentional rewriting of programs. To perform a rewrite during RUN, the mode must be changed to RUN-EDIT mode.
Change the mode as shown below. After the rewrite, change back to PROG-EDIT mode to prevent accidental rewriting.
Procedure for changing to RUN-EDIT mode

Procedure for changing to PROG-EDIT mode

### 8.8 Changing the Set Value of Timer/Counter During RUN

### 8.8 Changing the Set Value of Timer/Counter During RUN

### 8.8.1 Method of Rewriting Constant in FP Programmer II

## Rewrite Method Using FP Programmer II

Example of changing the set value of timer 5 from K30 to K50

## Procedure:

1. Read the address containing the timer instruction.

2. Clear the constant (K30).
HELP)
CLR
3. Enter the new constant (K50).

## Operation and Cautions After the Change

After the change, the timer or counter in operation will continue to run. Operation based on the changed set value will be started the next time the execution condition changes from off to on.

When this method is used, the program itself will change. Thus, when the mode is changed and then set back to RUN or when the power is turned on, the changed set value will be preset.

### 8.8.2 Method of Rewriting a Value in the Set Value Area

## Changing values in the set value area SV

Values in the set value area SV can be changed with the following procedures.

- Method using the programming tool software (FPWIN GR)
- Method using the FP Programmer II
- Method using the program (high-level instruction)

## Operation and cautions after the change

After the change, the timer or counter in operation will continue to run. Operation based on the changed set value will be started the next time the execution condition changes from off to on.

With these methods, the value in the set value area SV will change, however, the program itself will not change. Therefore, when the mode is changed and then set back to RUN or when the power is turned on, operation will take place as follows:
When a set value in the program is specified by a constant $K$
The constant K is preset in the set value area SV. After the change, it will no longer be effective.
When a set value in the program is specified by a set value area number
In the case of a non-hold type timer or counter, 0 is preset in the set value area SV. In the case of a hold type timer or counter, the value changed by the method on the following page is preset in the set value area SV.

### 8.8 Changing the Set Value of Timer/Counter During RUN

## Method 1: Method using the programming tool software

## Procedure:

Select "Monitoring Registers" from the Online menu.

## Explanation of each column

(1) Displays the line number.
(2) Displays the device code and device number.
(3) Displays the monitored data.

During online monitoring, you can make changes to the data by either pressing [Enter] in this column or by double clicking.
(4) Displays the base (decimal, hexadecimal, binary or ASCII) and the number of words.
(5) Displays the I/O comment for each register.

You can input I/O comments for each register by either pressing [Enter] in this column or by double clicking.

Click in each column and change the settings. For details, please refer to the FPWIN GR help menu.

The "FPWIN GR" tool software has a similar menu.
For information on operating the menus, please check the Help menu.

## Method 2: Method using the FP Programmer II

Use the word data monitor function to read the set value area SV of the timer or counter to be changed, and rewrite the value.
Example of changing the value of SV0 from K30 to K50.

## Procedure:

## 1. Execute word data monitor (OP8).

2. Read SVO.

3. Clear SVO.

## 4. Write the new changing value.

## Method 3: Method using the program (high-level instruction)

To change a set value of timer/counter based on an input condition, use a high-level instruction as shown below to rewrite the value in the set value area SV of the desired timer or counter.

Example: Changing the set value to K20 when input R0 turns on

### 8.9 Processing During Forced Input and Output

Processing when forced input/output is initiated during RUN

## Processing of external input (X)

Regardless of the state of the input from the input device, forced on/off operation will take precedence at a contact specified for forced input/output. At this time, the input LED will not blink, however, the area of input $X$ in the operation memory will be rewritten. Contacts not specified will read in the on/off state according to the condition of the input from the input device.

## Processing of external output ( Y )

Regardless of the result of operation, forced on/off will take precedence at a contact specified for forced input/output. At this time, the area of output Y in the operation memory will be forcedly rewritten. External output will take place according to the input/output update timing in the above diagram.
The on/off state of contacts not specified will be determined by the operation result.

## Timer (T) and Counter (C)

Regardless of the timer/counter input condition, forced on/off operation will take precedence at a contact specified for forced input/output. At this time, the contact of the timer ( T ) or counter (C) in the operation memory will be rewritten. Timing and counting will not take place during control.
The on/off state of contacts not specified will be determined by the operation result.

### 8.10 Setting the Clock/Calendar (T32CT type only)

## Ckock/Calendar setting area

The write area and read area for clock/calendar is allocated to special data registers DT90053 to DT90057.

| Special data register <br> number | Upper byte | Lower byte | Read | Write |
| :---: | :---: | :---: | :---: | :---: |
| DT90053 | Hour data <br> H00 to H23 | Minute data <br> H00 to H59 | Available | Not Available |
| DT90054 | Minute data <br> H00 to H59 | Second data <br> H00 to H59 | Available | Available |
| DT90055 | Day data <br> H01 to H31 | Hour data <br> H00 to H23 | Available | Available |
| DT90056 | Year data <br> H00 to H99 <br> DT90057 | Month data <br> H01 to H12 | Available | Available |
| D-- | Day of week data <br> H00 to H06 | Available | Available |  |

## Clock/Calendar setting

There are three ways to set the clock/calendar, as follows.

## - When using the Windows version of FPWIN

1. While online, open the setting menu by selecting [Tool] and then [Set PLC Date and Time].
2. Enter the "Date" and "Time" and press [OK].

## - When using DOS version software

1. While online, select [Monitor] and then [Data monitor].
2. Select [Save data] (f6) and then save data registers DT90054 to DT90057.
3. Select [Write ON] (f4) and [Data write] (f7) in that order and then write a value.
8.10 Setting the Clock/Calendar (T32CT type only)

## - Setting and changing using a program

1. Transfer the value to be written into special data registers DT90054 to DT90057 that are allocated in clock/calendar setting area.
2. Write H8000 to DT90058.

Note: Execute the transfer using "P" type (derivative execution) instruction or transfer in the order of H8000 to H0000.

Example: With X0 on, adjust to the 5th day, 12:00:00.

## Caution regarding backup of clock/calendar data

- Clock/Calendar values are backed up in the secondary battery.
- Do not use until the secondary battery has been sufficiently charged.
- When first used no value has been determined; therefore, please write values using a programming tool or similar.

### 9.1 Outline of Functions

### 9.1.1 Three Functions that Use Built-in High-speed Counter

## Functions that use the built-in high-speed counter

There are three functions available when using the high-speed counter built into the FPO.

## High-speed counter function

The high-speed counter function counts external inputs such as those from sensors or encoders. When the count reaches the target value, this function turns on/off the desired output.

## Pulse output function

Combined with a commercially available motor driver, the pulse output function enables positioning control. With the appropriate instruction, you can perform trapezoidal control, home return, and JOG operation.

### 9.1 Outline of Functions

## PWM output function

By using the appropriate instruction, the PWM output function enables a pulse output of the desired duty ratio.

When you increase the pulse width...

### 9.1.2 Performance of Built-in High-speed Counter

## Channel number

There are four channels for the built-in high-speed counter.
The channel number allocated for the high-speed counter will change depending on the function being used.

## Counting range

K-8388608 to K8388607
(HFF8000 to H7FFFFF)
(Coded 24-bit binary)

### 9.2 Specifications and Restricted Items

### 9.2.1 Specifications

Table of high-speed counter function specifications

| Input/output contact number being used |  |  | Built-in highspeed counter channel no. | Memory area used |  |  | Performance specifications |  |  | Related instructions |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| On/off output | Count mode | Input contact number (value in parenthesis is reset input) |  | Control flag | Elapsed value area | Target value area | Minimum input pulse width | Maximum counting speed |  |  |
|  |  |  |  |  |  |  |  | Using only 1 channel | Using multiple channels |  |
| Specify the <br> desired output from Y0 to Y7 | Incremental input, Decremental input | $\begin{gathered} \hline \mathrm{XO} \\ \text { (X2) } \end{gathered}$ | CHO | R903A | DT9044, <br> DT9045/ <br> DT90044, <br> DT90045 | DT9046, <br> DT9047/ <br> DT90046, <br> DT90047 | $50 \mu \mathrm{~s}$ | $\begin{gathered} \hline \text { Max. } \\ 10 \mathrm{kHz} \end{gathered}$ | Total of 4 CH with max. 10 kHz | $\begin{aligned} & \hline \text { F0 (MV), } \\ & \text { F1 (DMV), } \\ & \text { F166 } \\ & \text { (HC1S), } \\ & \text { F167 } \\ & \text { (HC1R) } \end{aligned}$ |
|  |  | $\begin{gathered} \hline \mathrm{X} 1 \\ (\mathrm{X} 2) \end{gathered}$ | CH1 | R903B | DT9048, DT9049/ DT90048, DT90049 | DT9050, DT9051/ DT90050, DT90051 |  | $\begin{gathered} \text { Max. } \\ 10 \mathrm{kHz} \end{gathered}$ |  |  |
|  |  | $\begin{gathered} \hline \text { X3 } \\ \text { (X5) } \end{gathered}$ | CH 2 | R903C | DT9104, <br> DT9105/ <br> DT90104, <br> DT90105 | DT9106, <br> DT9107/ <br> DT90106, <br> DT90107 | $100 \mu \mathrm{~s}$ | Max. 5 kHz |  |  |
|  |  | $\begin{gathered} \hline \mathrm{X} 4 \\ \text { (X5) } \end{gathered}$ | CH3 | R903D | DT9108, <br> DT9109/ <br> DT90108, <br> DT90109 | DT9110, <br> DT9111/ DT90110, DT90111 |  | Max. 5 kHz |  |  |
| Specify the <br> de- <br> sired output from YO to Y7 | 2-phas <br> e input, Incremental/ decremental input, Directional distinction | $\begin{gathered} \mathrm{X0} \\ \mathrm{X} 1 \\ \mathrm{X} 2) \end{gathered}$ | CHO | R903A | DT9044, DT9045/ DT90044, DT90045 | DT9046, <br> DT9047/ <br> DT90046, DT90047 | $250 \mu \mathrm{~s}$ | $\begin{gathered} \text { Max. } \\ 2 \mathrm{kHz} \end{gathered}$ | Total of 2 CH with max. 2 kHz |  |
|  |  | $\begin{gathered} \hline \mathrm{X} 3 \\ \mathrm{X} 4 \\ \text { (X5) } \end{gathered}$ | CH2 | R903C | DT9104, <br> DT9105/ DT90104, DT90105 | DT9106, <br> DT9107/ DT90106, DT90107 | $500 \mu \mathrm{~s}$ | $\begin{aligned} & \text { Max. } \\ & 1 \mathrm{kHz} \end{aligned}$ |  |  |

Note
Reset input X2 can be set to either CH0 or CH1. Reset input X5 can be set to either CH 2 or CH 3 .

### 9.2 Specifications and Restricted Items

Table of pulse output function specifications

| Input/output contact number being used |  |  |  | Built-in highspeed counter channel no. | Memory area used |  |  | Performance specifications for maximum output frequency | Related instructions |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Pulse output | Directional output | Home input | Near home input |  | Con- <br> trol <br> flag | Elapsed value area | Target value area |  |  |
| Y0 | Y2 | X0 | DT9052/ DT90052 <bit2> | CH0 | R903A | DT9044, <br> DT9045 <br> DT90044, <br> DT90045 | DT9046, DT9047/ DT90046, DT90047 | Max. <br> 10 kHz for 1-point output Max. | ```F0 (MV), F1 (DMV), F168 (SPD1),``` |
| Y1 | Y3 | X1 | $\begin{array}{\|l\|} \hline \text { DT9052/ } \\ \text { DT90052 } \\ \text { <bit6> } \end{array}$ | CH 1 | R903B | DT9048, <br> DT9049/ <br> DT90048, <br> DT90049 | $\begin{array}{\|c\|} \hline \text { DT9050, } \\ \text { DT9051/ } \\ \text { DT90050, } \\ \text { DT90051 } \end{array}$ | 2-point output |  |

Note
The maximum 1-point output for instruction F168 (SPD1) is 9.5 kHz.

Table of PWM output specifications

| Output number being used | Built-in <br> high-speed <br> counter <br> channel no. | Memory area used | Performance <br> specifications <br> for output <br> frequency | Related <br> instructions |
| :--- | :--- | :--- | :--- | :--- |
|  | Control flag | R903A | Frequency: <br> 0.15 Hz to 38 Hz <br> (CPU ver. 2.0 or <br> later: 100 to 1 kHz$)$ | F170 (PWM) |
| Y0 | CH0 | Duty: <br> $0.1 \%$ to $99.9 \%$ |  |  |
| Y1 | CH1 | R903B |  |  |

### 9.2.2 Functions and Restrictions

## Channel

The same channel cannot be used by more than one function.

## Example of prohibited application:

You cannot share CHO with the high-speed counter and pulse output functions.

## I/O number (input/output contact point)

The number allocated to each function cannot be used for normal input or outputs.

## Example of prohibited application

When using CHO for 2-phase inputting with the high-speed counter function, you cannot allot $\mathrm{X0}$ and X 1 to normal inputs.
When using YO for the pulse output function, you cannot allot origin input XO to a normal input.
When using YO for the pulse output (with directional output operating) function, you cannot allot Y2 (directional output) to a normal input or output.
When using the high-speed counter with a mode that does not use the reset input, you can allot the inputs listed in parenthesis in the specifications table to a normal input.

## Example of allowable application

When using the high-speed counter with no reset input and 2-phase input, you can allot X 2 to a normal input.

## Restrictions on the execution of related instructions (F166 to F170)

When any of the instructions related to the high-speed counter ( $\mathbf{F} 166$ to $\mathbf{F 1 7 0}$ ) are executed, the control flag (special internal relay: R903A to R903D) corresponding to the used channel turns on.
When the flag for a channel turns on, another instruction cannot be executed using that same channel.

## Example of prohibited application

While executing F166 (target value match on instruction) and flag R903A is in the on state, F167 (target value match off instruction) cannot be executed with CHO .

### 9.2 Specifications and Restricted Items

Restrictions for maximum counting speed/pulse output frequency
The counting speed when using the high-speed counter function will differ depending on the counting mode as shown in the table.

## $\stackrel{y}{c}$ <br> Example 1:

While in the incremental input mode and using the two channels CHO and CH 1 , if CHO is being used at 8 kHz , then CH1 can be used up to $2 \mathbf{k H z}$.

## $\stackrel{N}{5}$ <br> Example 2:

While in the 2-phase input mode and using the two channels CHO and CH 2 , if CHO is being used at $1 \mathbf{k H z}$, then CH 2 can be used up to 1 kHz .

The maximum output frequency when using the pulse output function will differ depending on the output contact number as shown in the table.
$\stackrel{y}{c}$
Example 1:
When using either only Y0 or only Y1, the maximum output frequency is 10 kHz .

Example 2:
When using the two contacts Y0 and Y1, the maximum output frequency is 5 kHz .

When using the high-speed counter function and pulse output function, specifications will differ depending on the conditions of use.

## s <br> Example:

When using one pulse output contact with a maximum output frequency of 5 kHz , the maximum counting speed of the high-speed counter being used simultaneously is 5 kHz with the incremental mode and 1 kHz with the 2-phase mode.

### 9.3 High-speed Counter Function

### 9.3.1 Outline of High-speed Counter Function

## High-speed counter function

The high-speed counter function counts the input signals, and when the count reaches the target value, turns on and off the desired output.

The high-speed counter function is able to count high-speed pulses of frequencies up to 10 kHz .

To turn on an output when the target value is matched, use the target value match on instruction (F166). To turn off an output, use the target value match off instruction (F167).
Preset the output to be turned on and off with the SET/RET instruction.

## Setting the system register

In order to use the high-speed counter function, it is necessary to set system registers 400 and 401. For detailed information section ****

### 9.3.2 Types of Input Modes

## Incremental input mode

## Decremental input mode

### 9.3 High-speed Counter Function

## 2-phase input mode

Incremental/decremental input mode (separate input mode)

Directional distinction mode

### 9.3.3 I/O Allocation

The inputting, as shown in the table on section 9.2.1, will differ depending on the channel number being used.

The output turned on and off can be specified from Y0 to Y 7 as desired with instructions F166 and F167.
When using CHO with incremental input and reset input

* The output turned on and off when values match can be specified from Y 0 to Y 7 as desired.

## When using CHO with 2-phase input and reset input

* The output turned on and off when values match can be specified from Y 0 to Y 7 as desired.

### 9.3.4 Instructions Used with High-speed Counter Function

## High-speed counter control instruction (F0)

This instruction is used for counter operations such as software reset and count disable.
Specify this instruction together with the FO (MV) instruction and the special data register DT9052/DT90052.

Once this instruction is executed, the settings will remain until this instruction is executed again.

## Operations that can be performed with this instruction

Counter software reset.
Count enable/disable.
Hardware reset enable/disable.
Clear controls from high-speed counter instructions F166 to F170.
Clear target value match interrupt.

## $\stackrel{y}{s}$ <br> Example:

## Performing a software reset

In the above program, the reset is performed in step (1) and 0 is entered just after that in step (2). The count is now ready for operation. If it is only reset, counting will not be performed.

## Elapsed value change and read instruction (F1)

This instruction changes or reads the elapsed value of the high-speed counter.
Specify this instruction together with the F1 (DMV) instruction and the special data register DT9044/DT90044.
The elapsed value is stored as 32-bit data in the combined area of special data registers DT9044 and DT9045/DT90044 and DT90045.
Use this F1 (DMV) instruction to set the elapsed value.

## N <br> Example 1:

Set the initial value of K3000 in the high-speed counter (example of changing the elapsed value).

$$
\mid \mathrm{H}^{\mathrm{X7}}-(\mathrm{DF})-[\text { F1 DMV, K3000, DT9044 }] \mid
$$

## Example 2:

Reads the elapsed value of the high-speed counter and copies it to DT100.

$$
\mid \mathrm{H}^{\mathrm{X7}}-(\mathrm{DF})-[\text { F1 DMV, DT9044, DT100 }] \mid
$$

Each time the ED instruction is executed, the elapsed value is automatically transferred from the elapsed value area to the special data registers DT9044 and DT9045/ DT90044 and DT90045.

Target value match on instruction (F166)

If the elapsed value (DT9044 and DT9045/DT90044 and DT90045) for channel 0 matches K10000, output Y7 turns on.

$|$| XB | (DF $)$ [F166 HC1S, K2, K20000, Y6 ] |
| :---: | :---: |

If the elapsed value (DT9104 and DT9105/DT90104 and DT90105) for channel 2 matches K20000, output Y6 turns on.
Target value match off instruction (F167)
$\left\lvert\, \begin{aligned} & \text { XC } \\ & \mathrm{H}-(D F) —[F 167 ~ H C 1 R, ~ K 1, ~ K 30000, ~ Y 4 ~] ~\end{aligned}\right.$
If the elapsed value (DT9048 and DT9049/DT90048 and DT90049) for channel 1 matches K30000, output Y4 turns off.
$\left|\begin{array}{l}\mathrm{XD} \\ \mathrm{H} \\ \text { (DF })-[F 167 \text { HC1R, K3, K40000, Y5 ] }\end{array}\right|$
If the elapsed value (DT9108 and DT9109/DT90108 and DT90109) for channel 3 matches K40000, output Y5 turns off.

### 9.3 High-speed Counter Function

### 9.3.5 Sample Program

## Wiring examples

9.3 High-speed Counter Function

## Positioning operations with a single speed inverter

When X5 is turned on, Y0 turns on and the conveyor begins moving. When the elapsed value (DT9044 and DT9045) reaches K5000, Y0 turns off and the conveyor stops.

### 9.3 High-speed Counter Function

## Wiring example

9.3 High-speed Counter Function

## Positioning operations with a double speed inverter

When X 5 is turned on, Y 0 and Y 1 turn on and the conveyor begins moving. When the elapsed value (DT9044 and DT9045) reaches K4500, Y1 turns off and the conveyor begins decelerating. When the elapsed value reaches K5000, Y0 turns off and the conveyor stops.

### 9.4 Pulse Output Function

### 9.4 Pulse Output Function

### 9.4.1 Outline of Pulse Output Function

## Instructions used and control settings

The pulse function enables positioning control by use in combination with a commercially available pulse-string input type motor driver.
Provides trapezoidal control with the instruction F168 for automatically obtaining pulse outputs by specifying the initial speed, maximum speed, acceleration/deceleration time, and target value.

Instruction F168 also enables automatic home return.
JOG operation with the instruction F169 for pulse output while the execution condition (trigger) is in the on state.

## Setting the system register

When using the pulse output function, set the channels corresponding to system registers 400 to "Do not use high-speed counter."

### 9.4.2 Control Mode

## Incremental <relative value control>

Outputs the pulse of the pulse number set by the target value.
By setting H02 (incremental; forward: off; reverse: on) in the control code with instruction F168, when the target value is positive, the directional output is turned off and the elapsed value of the high-speed counter increases. When the target value is negative, the directional output turns on and the elapsed value of the high-speed counter decreases. By setting H03 in the control code, the directional output is the reverse of that above.
For detailed information F168 (SPD1) and section 9.4.5

## Absolute <absolute value control>

Outputs the pulse set by the difference between the current value and the target value. (The difference between the current value and the target value is the output pulse number.)

By setting H12 (absolute; forward: off; reverse: on) in the control code with instruction F168, when the current value is less than the target value, the directional output is turned off and the elapsed value of the high-speed counter increases. When the current value is greater than the target value, the directional output turns on and the elapsed value of the high-speed counter decreases. By setting H13 in the control code, the directional output is the reverse of that above.
For detailed information F168 (SPD1) and section 9.4.5

## Home return

Until the home input ( X 0 or X 1 ) is entered by executing instruction F 168 , the pulse is continuously output.

To decelerate the movement when near the home, set the bit corresponding to DT9052/ DT90052 to off $\rightarrow$ on $\rightarrow$ off $\rightarrow$ with the near home input.
For detailed information F0 (MV), F168 (SPD1) and section 9.4.5

## JOG operation

Pulses are output from the specified channel while the trigger for instruction F169 is in the on state.

The directional output and output frequency are specified by instruction F169.
For detailed information F169 (PLS) and section 9.4.5

### 9.4 Pulse Output Function

### 9.4.3 I/O Allocation and Wiring

## Single pulse input driver (pulse input and directional switching input)

One output point is used as a pulse output and the other output is used as a directional output.

The pulse output terminal, directional output terminal, and home input I/O allocation is determined by the channel used. For detailed information section 9.2.1
Near home input is substituted by allocating the desired contact point and turning on and off the specified bit of DT9052/DT90052.
For detailed information - FO (MV)
Up to two driver systems can be connected.
When using CHO

* The near home input specifies the desired input, such as X 2 .

When using CH1

* The near home input specifies the desired input, such as X 3 .

## Double pulse input driver (CW pulse input and CCW pulse input)

Since a double pulse input is used, switching must be performed by an external relay.
One output contact is used as a pulse output for relay switching.
The pulse output terminal and home input I/O allocation is determined by the channel used. For detailed information section 9.2.1
Set the control code for instruction F168 to "No directional output."
For detailed information F168 (SPFD1)

## When using CHO

* X2 or other desired input can be specified for the near home input.
** Y4 or other desired output can be specified for the relay switching. At this time, the relay must be switched earlier by the amount of its operation time.

## Caution when using a double pulse input driver

When using the FPO pulse outputs YO and Y 1 for direct connection to the CW input and CCW input of a driver, the counter elapsed values for the separate channels (ch0 and ch1) increase and decrease in response to the individual outputs. The elapsed values can thus be sent to the program as necessary.

### 9.4 Pulse Output Function

### 9.4.4 Instructions Used with Pulse Output Function

## Positioning control instruction (F168)

Automatically performs trapezoidal control according to the specified data table.

|  | F0 MV, H102, DT100 |
| :---: | :---: |
|  | [ FO MV, K500, DT101 |
|  | [ FO MV, K5000, DT102 |
|  | [ FO MV, K200, DT103 |
|  | [ F1 DMV, K10000, DT104 |
|  | [ FO MV, K0, DT106 |
|  | [ F168 SPD1, DT100, H0 |

Generates a pulse from output Y 0 at an initial speed of 500 Hz , a maximum speed of 5000 Hz , an acceleration/deceleration time of 200 ms , and a movement amount of 10000 pulses.

At this time the high-speed counter elapsed value (DT9044 and DT9045/DT90044 and DT90045) will be increasing.

- For trapezoidal control, set the initial speed to no more than 5000 Hz .
- For details on troubleshooting procedures when no pulse is output when instruction F168 (SPD1) is executed, refer to page 9-32.

## Pulse output instruction (F169)

This instruction is for JOG operation by obtaining a pulse from the desired output when the execution condition (trigger) turns on.

While X 2 is in the on state, a pulse of 300 Hz with a duty ratio of $10 \%$ is output from YO . At this time, directional output (Y2) is off and the count of the elapsed value for the high-speed counter CH0 (DT9044 and DT9045/DT90044 and DT90045) increases.

While X 6 is in the on state, a pulse of 700 Hz with a duty ratio of $10 \%$ is output from Y 1 . At this time, directional output (Y3) is off and the count of the elapsed value for the high-speed counter CH1 (DT9048 and DT9049/DT90048 and DT90049) decreases.

## High-speed counter control instruction (F0)

This instruction is used for resetting the built-in high-speed counter, stopping the pulse outputs, and setting and resetting the near home input.
Specify this instruction together with the F0 (MV) instruction and the special data register DT9052/DT90052.
Once this instruction is executed, the settings will remain until this instruction is executed again.

## Operations that can be performed with this instruction

Clear controls (stopping the pulse outputs) from high-speed counter instructions F166 to F170.

Near home processing for home return operations.

Example 1: Enable the near home input during home return operations and begin deceleration.

In the above program, the near home input is enabled in step (1) and 0 is entered just after that in step (2) to perform the preset operations.

## Example 2: Performing a forced stop of the pulse output.

## Elapsed value write and read instruction (F1)

This instruction is used to read the pulse number counted by the built-in high-speed counter.

Specify this instruction together with the F1 (DMV) instruction and the special data register DT9044/DT90044.
The elapsed value is stored as 32-bit data in the combined area of special data registers DT9044 and DT9045/DT90044 and DT90045.

Use this F1 (DMV) instruction to set the elapsed value.
Example 1: Set the initial value of K 3000 in the high-speed counter (example of writing the elapsed value).

$\stackrel{y}{s}$
Example 2: Reads the elapsed value of the high-speed counter to DT100.

Each time the ED instruction is executed, the elapsed value is automatically transferred from the elapsed value area to the special data registers DT9044 and DT9045/DT90044 and DT90045.

### 9.4.5 Sample Program for Positioning Control

Wiring example
FPO

## Note

When the stepping motor input is a 5 V photo-coupler type, connect a $2 \mathrm{~K} \Omega$ 1/4 W resistor.

### 9.4 Pulse Output Function

## Relative value positioning operation (plus direction)

When X1 turns on, a pulse is output from Y0. At this time, directional output Y2 does not turn on.

Positioning operations running
Positioning operations start

| DT100 | Control code: H102 <br> [refer to "instruction <br> F168 (SPD1)"] |
| :--- | :--- |
| DT101 | Initial speed: 500 Hz |
| DT102 | Maximum speed: <br> 5000 Hz |
| DT103 | Acceleration/decelera- <br> tion time: 200 ms |
| DT104 | Movement amount: <br> DT105 |
| 10000 pls |  |

Positioning completion pulse (1 s)

## Relative value positioning operation (minus direction)

When X2 turns on, a pulse is output from Y0. At this time, directional output Y2 turns on.

### 9.4 Pulse Output Function

## Absolute value positioning operation

When X 1 is turned on, pulses are output from Y0. If the current value at that point is larger than " 22,000 ", the direction output Y2 goes on, and if the value is smaller than "22,000", the direction output Y2 does not go on.

(- side)
(+ side)

Regardless of the current value, its movement is towards position "22,000."

## Home return operation (minus direction)

When X3 turns on, a pulse is output from YO and the return to home begins. At this time, directional output Y 2 turns on. Then, when X 4 turns on, deceleration begins, and when X0 turns on, home return is completed. After the return to home is completed, the elapsed value (DT9044 and DT9045/DT90044 and DT90045) are cleared to 0.

Home return operations running

Home return operation start

| DT200 | Control code: H123 <br> [refer to "instruction <br> F168 (SPD1)"] |
| :--- | :--- |
| DT201 | Initial speed: 100 Hz |
| DT202 | Maximum speed: <br> 2000 Hz |
| DT203 | Acceleration/decelera- <br> tion time: 150 ms |

Home return completion pulse

### 9.4 Pulse Output Function

## Home return operation (plus direction)

When X 3 turns on, a pulse is output from Y 0 and the return to home begins. At this time, directional output Y2 does not turn on. Then, when X 4 turns on, deceleration begins, and when X0 turns on, home return is completed. After the return to home is completed, the elapsed value (DT9044 and DT9045/DT90044 and DT90045) are cleared to 0.

Home return completion pulse

## JOG operation (plus direction)

While X 5 is in the on state, a pulse is output from Y0. At this time, directional output Y2 does not turn on.

| $\begin{aligned} \text { X5 } & {\left[\begin{array}{llll} \text { F0 MV, } & \text { H 112, } & \text { DT } 300 \end{array}\right] } \\ & {\left[\begin{array}{llll} \text { F0 MV, } & \text { K 300, } & \text { DT } 301 \end{array}\right] } \\ & {\left[\begin{array}{llll} \text { F169 PLS, } & \text { DT 300, } & \text { H } 0 \end{array}\right] } \end{aligned}$ |  |
| :---: | :---: |

|  |  |

| DT300 | Control code: H112 <br> [refer to "instruction <br> F169 (PLS)"] |
| :--- | :--- |
| DT301 | Speed: 300 Hz |

## JOG operation (minus direction)

While X 6 is in the on state, a pulse is output from Y0. At this time, directional output Y2 turns on.

| DT310 | Control code: H122 <br> [refer to "instruction <br> F169 (PLS)"] |
| :--- | :--- |
| DT311 | Speed: 300 Hz |

## Emergency stop (over limit)

If X 7 turns off while a pulse is being output from YO , the output of the pulse is stopped.

### 9.4 Pulse Output Function

Troubleshooting flowchart if a pulse is not output when instruction F168
(SPD1) executed

Please contact your dealer.

### 9.5 PWM Output Function

### 9.5.1 Outline of PWM Output Function

## PWM output function

With the instruction F170 (PWM), the specified duty ratio and pulse width modulation is obtained.

Applicable to analog controls such as temperature control and light modulation.

## Setting the system register

When using the PWM output function, set the channels corresponding to system registers 400 to "Do not use high-speed counter."

### 9.5.2 Instruction Used with PWM Output Function

PWM output instruction (F170)

While X 6 is in the on state, a pulse with a period of 840 ms and duty ratio of $50 \%$ is output from YO.

While X 7 is in the on state, a pulse with a period of 1.6 s and duty ratio of $30 \%$ is output from Y1.

### 9.5 PWM Output Function

## Chapter 10

## General-use Serial Communications

10.1 General-use Serial Communications Function ..... $10-3$
10.1.1 General-use Serial Communications ..... 10-3
10.1.2 Data Transmission ..... 10-3
10.1.3 Data Reception ..... 10-4
10.2 System Register Settings ..... $10-5$
10.3 Operations When Using General-use Serial Communication ..... $10-8$
10.3.1 If "None" is Set for Start and Terminal Codes ..... $10-8$
10.3.2 If "Yes" has been Set for the Start and Terminal Codes (Start Code: STX, Terminal Code: ETX) ..... $10-9$

### 10.1 General-use Serial Communications Function

### 10.1.1 General-use Serial Communications

Using the RS232C port, data and commands can be sent to and received from an external device such as a bar code reader. This is done by executing the F144 (TRNS) instruction.

Transmission and reception are not enabled in the default settings, so system register 412 must be changed to a general-use port (K2).
The transmission speed (baud rate) and transmission format are set using system register 413 and 414.

### 10.1.2 Data Transmission

Any desired data register can be prepared as the transmission table, and the data stored in that table transmitted.

Start and terminal codes are automatically added to the data being transmitted, and the data is sent. (For details, see "F144 (TRNS)" instruction.)
The data register to be used as the transmission table is specified using the F144 (TRNS) instruction.
Data transmission is executed using the F144 (TRNS) instruction.
There is no restriction on the number of bytes that can be transmitted. Any number of bytes may be sent, as long as it does not exceed the range that can be used by the data register.

### 10.1 General-use Serial Communications Function

### 10.1.3 Data Reception

Data sent from an external device is received at the RS232C port.
The received data is automatically stored in the data register specified as the reception buffer. (For details see "F144 (TRNS)" instruction.)
Data registers used as reception buffers are specified by system register 417 and 418.
Data reception is enabled by the F144 (TRNS) instruction.

### 10.2 System Register Settings

## Preparation for Sending and Receiving Data (System Register Settings)

Communication is not enabled in the default settings for the RS232C port. To enable communication, the items outlined below must be specified, using the system registers.

- Usage purpose of the RS232C port
- RS232C transmission format
- Baud rate
- Reception buffer

## Setting the Usage Purpose of the RS232C Port (System Register 412)

Specify "General-use port" (this is K2 for the FP Programmer II). This is the setting which enables serial communication.

## Setting the RS232C Transmission Format (System Register 413)

The transmission format is as follows in the default settings. (With the FP Programmer II, this is H3.)
Data length: 8 bits
Parity check: Yes/odd
Stop bit: 1 bit
Terminal code: CR
Start code: STX None
Set these items to match the external device connected to the RS232C port, and if changing the transmission format, enter settings for the pertinent individual items.
With the FP Programmer II, the various items should be selected in bit units, as shown below, and settings entered using H constants.

* next page

10-5

### 10.2 System Register Settings

## Start codes (STX) and terminal codes (EXT)

When data is transmitted, the specified code is added automatically to the data being sent. When receiving data, if "Yes" has been specified for the start code parameter, data following the start code is stored in the reception buffer. Also, at the point at which the terminal code is received, the reception completed flag (R9038) goes on. The start and terminal codes themselves are not stored in the reception buffer, however. For details, see section 10.3.2

## Note

If no terminal codes are specified for either transmission or reception, the reception completed flag will not go on. In this case, watch the number of bytes received to determine whether the reception has been completed.

Example: Changing the terminal code to [CR and LF]
Datalength

ChangeH3 (def ault value)t oH13.

## Setting the Baud Rate (System Register 414)

The baud rate (transmission speed) for general-use serial communication is set to "9600 bps" (H1) in the default settings.
To change this setting to match the external device connected to the RS232C port, select one of the values listed below.

Tool port
HO: 9600 bps HA: 19200 bps
If anything other than HO or H 1 is set for the baud rate of tool port, the baud rate will be 9600 bps.

RS232C port
HO: 19200 bps
H1: 9600 bps
H2: 4800 bps
H3: 2400 bps
H4: 1200 bps
H5: 600 bps
H6: 300 bps

Example: Setting 19,200 bps for both the tool port and RS232C port $\ni$ Write H100.

## Setting the Reception Buffer (System Registers 417 and 418)

In the default settings, all areas of the data registers are set to be used as reception buffers. To change the area of the data register used as the reception buffer, specify the initial number in system register 417, and the volume (number of words) in system register 418.
The reception buffer is configured as shown below.

### 10.3 Operations When Using General-use Serial Communication

### 10.3.1 If "None" is Set for Start and Terminal Codes

Relationship between the flags (reception completed flag and transmission completed flag) and the F144 (TRNS) instruction

Half-duplex transmission should be used for general-use serial communication.
Reception is disabled when the reception completed flag (R9038) is on.
Be aware that the reception completed flag (R9038) changes even while a scan is in progress. (Example: If the reception completed flag is used multiple times as an input condition, there is a possibility of different statuses existing within the same scan.)
When the F144 (TRNS) instruction is executed, the error flag (R9037), reception completed flag (R9038) and transmission completed flag (R9039) go off.
Duplex transmission is disabled while the F144 (TRNS) instruction is being executed. Check the transmission completed flag (R9039) to determine whether duplex transmission is possible.

When the F144 (TRNS) instruction is executed, the number of bytes received is cleared, and the address (write pointer) returns to the initial address in the reception buffer.
Reception stops if the error flag (R9037) goes on. To resume reception, execute the F144 (TRNS) instruction. This turns off the error flag, and transmits both actual and empty data.

### 10.3.2 If "Yes" has been Set for the Start and Terminal Codes (Start Code: STX, Terminal Code: ETX)

## When receiving data

The data is stored in the reception buffer in sequential order, but at the point at which the start code is received, the number of bytes received is cleared, and the address (write pointer) is returned to the initial address in the reception buffer.

When the F144 (TRNS) instruction is executed, the number of bytes received is cleared, and the address (write pointer) is returned to the initial address in the reception buffer.

If there are two start codes, data following the later start code is overwritten and stored in the reception buffer.
Reception is disabled while the reception completed flag (R9038) is on.
The reception completed flag (R9038) is turned off by the F144 (TRNS) instruction. Because of this, if the F144 (TRNS) instruction is executed at the same time that the terminal code is received, the reception completed flag will not be detected.
10.3 Operations When Using General-use Serial Communication

## When sending data

## Transmission point

Start codes (STX) and terminal codes (ETX) are automatically added to the data being transmitted, and the data is transmitted to an external device. (For information on start and terminal code settings, see section 10.2.)
Executing the F144 (TRNS) instruction turns off the transmission completed flag (R9039).
Duplex transmission is disabled while the F144 (TRNS) instruction is being executed. Check the transmission completed flag (R9039) to determine whether duplex transmission is possible.

## Chapter 11

## Self-Diagnostic and Troubleshooting

11.1 Self-Diagnostic Function ..... $11-3$
11.1.1 Allowing Duplicated Output ..... $11-4$
11.1.2 Continuing After an Operation Error ..... 11-4
11.2 Troubleshooting ..... $11-5$
11.2.1 ERROR/ALARM LED is Blinking ..... 11-5
11.2.2 ERROR/ALARM LED is ON ..... 11-7
11.2.3 All LEDs are OFF ..... 11-7
11.2.4 Diagnosing Output Malfunction ..... 11-8
11.2.5 PROTECT ERROR is Displayed ..... 11-10
11.2.6 Program Mode does not Change to RUN ..... 11 - 10

### 11.1 Self-Diagnostic Function

The FPO control unit has a self-diagnostic function which identifies errors and stops operation if necessary. When an error occurs, the status of the status indicator LEDs on the FPO control unit vary, as shown in the table.

| Condition | LED status |  |  | Description | Program execution status |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | RUN | PROG. | ERROR/ALARM |  |  |
| Normal condition | ON | OFF | OFF | Normal operation in RUN mode | Operation |
|  | OFF | ON | OFF | Normal operation in PROG. mode | Stop |
|  | Blink | OFF | OFF | Forcing ON/OFF in RUN mode | Operation |
| Abnormal condition | ON | OFF | Blink | When a self-diagnostic error occurs | Operation |
|  | OFF | ON | Blink |  | Stop |
|  | Varies | Varies | ON | When a system watchdog timer error occurs | Stop |

Normally, if an error occurs, operation of FPO stops.
The user may select whether operation is to be continued or stopped if a duplicate output error or operation error occurs, by setting the system registers. You can set the system registers with TOOL software.
11.1 Self-Diagnostic Function

### 11.1.1 Allowing Duplicated Output

When you change system register 20 settings ("ENAB") using the programming software, duplicated output is not regarded as an error and the FPO continues to operate.

### 11.1.2 Continuing After an Operation Error

When you change system register 26 settings ("CONT") using the programming software, the FPO continues to operate. In this case, even if the FPO continues to operate, this is regarded as an error.

### 11.2 Troubleshooting

### 11.2.1 ERROR/ALARM LED is Blinking

## <Condition>

The self-diagnostic error occurs.

## <Procedure 1 >

Check the error code using the programming tool.

## Using FPWIN GR

In the ONLINE mode, select "Monitor" from the menu bar of FPWIN GR. And then select "Status Display". At the "PLC Error Flag" field, self-diagnostic error code is displayed.

## Using FP programmer II

Press the keys on the FP programmer II
 as shown on the right.
When self-diagnostic error occurs, the screen shown on the right is displayed.

OP- 110 FUNCTION ERR E45

## Error code is 1 to 9

- <Condition>

There is a syntax error in the program.
<Procedure 1 >
Change to PROG. mode and clear the error.

## <Procedure 2>

Execute a total-check function to determine the location of the syntax error.
Refer to your software manual, for details about the total-check method.

### 11.2 Troubleshooting

## Error code is 20 or higher

## <Condition>

A self-diagnostic error other than a syntax error has occurred.
<Procedure 1 >
Use the programming tool in PROG. mode to clear the error.

## Using FPWIN GR

Click the "Clear Error" button in the status display menu described on the previous page.

## Using FP programmer II

Press the keys as shown on the right.

Error code 43 and higher can be cleared.

- In the PROG. mode, the power supply can be turned OFF and then ON again to clear the error, but all of the contents of the operation memory except hold type data are cleared.
- An error can also be cleared by executing a self-diagnostic error set instruction F148 (ERR).
<Procedure 2 >
Follow the procedures described in the table of error codes.

Note
When an operation error (error code 45) occurs, the address at which the error occurred is stored in special data registers DT9017 and DT9018. If this happens, monitor the address at which the error occurred before cancelling the error.

### 11.2.2 ERROR/ALARM LED is ON

## <Condition>

The system watchdog timer has been activated and the operation of FPO has been stopped.
<Procedure 1 >
Set the mode switch from RUN to PROG. and turn the power OFF and then ON.
If the ERROR/ALARM LED is turned ON again, there is probably an abnormality in the FPO. Please contact your dealer.

If the ERROR/ALARM LED is blinked, go to section 11.2.1.
<Procedure 2 >
Set the mode switch from PROG. to RUN.

If the ERROR/ALARM LED is turned ON, the program execution time is too long. Check:

- If instructions such as JP or LOOP are programmed in such a way that a scan can never finish.
- that interrupt instructions are executed in succession.

### 11.2.3 All LEDs are OFF

<Procedure 1 >
Check the power supply wiring.

## <Procedure 2>

Check if the power supplied to the FPO control unit is in the range of the rating.
Be sure to check the fluctuation in the power supply.
<Procedure 3>
Disconnect the power supply wiring to the other devices if the power supplied to the FPO control unit is shared with them.

If the LEDs on the FPO control unit turn ON at this moment, the capacity of the power supply is not enough to control other devices as well.

Prepare another power supply for other devices or increase the capacity of the power supply.
11.2 Troubleshooting

### 11.2.4 Diagnosing Output Malfunction

## Check of output condition (output indicator LEDs are ON)

## <Procedure 1 >

Check the wiring of the loads.
<Procedure 2>
Check if the power is properly supplied to the loads.
If the power is properly supplied to the load, there is probably an abnormality in the load. Check the load again.

If the power is not supplied to the load, there is probably an abnormality in the FPO's output circuit. Please contact your dealer.

## Check of output condition (output indicator LEDs are OFF)

## <Procedure 1 >

Monitor the output condition using a programming tool.
If the output monitored is turned ON , there is probably a duplicated output error.
<Procedure 2>
Forcing ON the output using a programming tool.
If the output indicator LED is turned ON, go to input condition check.
If the output indicator LED remains OFF, there is probably an abnormality in the FPO's output circuit. Please contact your dealer.

## Check of input condition (input indicator LEDs are OFF)

<Procedure 1 >
Check the wiring of the input devices.

## <Procedure 2>

Check that the power is properly supplied to the input terminals.
If the power is properly supplied to the input terminal, there is probably an abnormality in the FPO's input circuit. Please contact your dealer.
If the power is not properly supplied to the input terminal, there is probably an abnormality in the input device or input power supply. Check the input device and input power supply.

## Check of input condition (input indicator LEDs are ON)

<Procedure >
Monitor the input condition using a programming tool.
If the input monitored is OFF, there is probably an abnormality in the FPO's input circuit. Please contact your dealer.
If the input monitored is ON , check the program again.
Also, check the leakage current at the input devices (e.g., two-wire type sensor) and check for the duplicated use of output or the program flow when a control instruction such as MC or JP is used.

Check the settings of the I/O allocation.

### 11.2 Troubleshooting

### 11.2.5 PROTECT ERROR is Displayed

## When a password is set for the programmable controller

## <Procedure>

Enter a password in the password setting menu in the FPWIN GR software and select enable.

1. In the menu select [Tool (T)] and then [Set PLC Password (P)].
2. The PLC password setting dialog box appears, shown below. Select the [Access] radio button, enter the password, and then click the [Settings] button.

### 11.2.6 Program Mode does not Change to RUN

## <Condition>

A syntax error has occurred.
<Procedure >
Execute a total-check function to determine the location of the syntax error.
Refer to your software manual, for details about the total-check method.

## Chapter 12

## Specifications

12.1 Performance Specifications ..... 12-3
12.2 I/O Allocation Table ..... 12-7
12.3 Relays, Memory Areas and Constants ..... 12-10
12.4 FPO-SL1 S-LINK Address ..... 12-12
12.5 Specification: Power Supply Unit I/O Link Unit ..... 12-13
12.5.1 FPO Power Supply Unit (AFP0634) ..... 12-13
12.5.2 FPO I/O Link Unit ..... 12-13

### 12.1 Performance Specifications

| Item |  |  | Relay output type |  | Transistor output type |  |  | $\begin{array}{\|l\|} \hline \begin{array}{l} \text { S-LINK } \\ \text { type } \end{array} \\ \hline \text { SL1 } \end{array}$ |

next page

Notes

1) Hold or non-hold type can be set using the system registers.
2) The proportion of timer points to counter points can be changed using a system register 5.
3) Precision of calender timer:

At $0^{\circ} \mathrm{C} / 32^{\circ} \mathrm{F}$, less than 139 second error per month. At $25^{\circ} \mathrm{C} / 77^{\circ} \mathrm{F}$, less than 72 seconds error per month. At $55^{\circ} \mathrm{C} / 131^{\circ} \mathrm{F}$, less than 169 seconds error per month. This accuracy is considered to be the worst fluctuation coefficient value based on fluctuations in the normal voltage of 5V and the battery backup voltage of 3V. Also, F157 and F158 (time/date addition and subtraction instructions) cannot be used.
4) Although it has adequate tolerance noise, it is recommendable to make the user program to execute retransmission (in order to improve reliability of the communication when a communication error occurs due to excessive noises or when a receiver equipment cannot receive data temporarily.) The driver IC for the RS232C is in full conformance with EIA/TIA-232E and CCITT V. 28 standards.
5) The combinations 1 phase $\times 2$ channels and 2 phases $\times 1$ channel are also possible for the high-speed counter.
6) The internal relay, data register, and timer/counter hold areas of the T32CT control unit (10 k step type) can be changed by the system registers. The number of points in the table is the value when the system registers are initial values.
7) The max. counting speed ( 10 kHz ) is the counting speed with a rated input voltage of 24V DC and an ambient temperature of $25^{\circ} \mathrm{C}$. The counting speed (frequency) will decrease depending on the voltage and temperature.
8) If both reset inputs $X 0$ and $X 1$ are reset, $X 2$ will be the reset input of X 1 . In the same way, for X 3 and $\mathrm{X} 4, \mathrm{X} 5$ acts as the reset input of X4.
9) With a CPU of Ver. 1.2 or a subsequent version, the frequency will be 0.15 Hz to 1 kHz .
10) The maximum is 9.5 kHz when the positioning control instruction ( F 168 ) is executed.
11) Precautions when using the battery backup function Secondary (chargeable) battery is used as backup battery in the FP0 T32C control unit. The battery is not charged before the unit is shipped, so please make sure that the built-in backup battery have been charged before using the unit.
12) The program, system registers and the hold type areas (internal relay, data register and counter) are backed up by the built in EEPROM.

## Notes

13) The possible number of write times by the EEPROM write instruction is 100,000 or less.
14) The possible number of write times by the EEPROM write instruction is 10,000 or less.
15) If the power supply is turned off while the P13 instruction is being executed, the data written by the P13 instruction may not be written in the EEPROM properly. Also, the area where the internal relays, data registers and timer/counter are held may not be held properly. Do not turn off the power supply while the P13 instruction is being executed.
16) The contact information and the elapsed value (EV) of the counter is backed up. The setting value (SV) is not held.

### 12.2 I/O Allocation Table

### 12.2 I/O Allocation Table

## FPO Control Units

The I/O allocation of the FPO control unit is fixed.

| Type of Control Unit |  | I/O number |
| :---: | :---: | :---: |
| C10 series | Input: 6 points | X0 to X5 |
|  | Output: 4 points | Y0 to Y3 |
| C14 series | Input: 8 points | X0 to X7 |
|  | Output: 6 points | Y0 to Y5 |
| C16 series | Input: 8 points | X0 to X7 |
|  | Output: 8 points | Y0 to Y7 |
| C32/T32 series | Input: 16 points | X0 to XF |
|  | Output: 16 points | Y0 to YF |

## S-LINK Control Units

The I/O allocation of the S-LINK control unit is fixed.

| Unit | FP0 I/O | S-LINK address |
| :--- | :--- | :--- |
| Input: 64 points | X80 to X8F | 0 to 15 |
|  | X90 to X9F | 16 to 31 |
|  | X100 to X10F | 32 to 47 |
|  | X110 to X11F | 48 to 63 |
| Output: 64 points | Y80 to Y8F | 64 to 79 |
|  | Y90 to Y9F | 80 to 95 |
|  | Y100 to Y10F | 96 to 111 |
|  | Y110 to Y11F | 112 to 127 |

## FPO Expansion Units

The I/O allocation of the FPO expansion unit is determined by order of connection.

| Type of Expansion Unit |  | I/O number |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | First expansion | Second expansion | Third expansion |
| E8X | Input: 8 points | X20 to X27 | X40 to X47 | X60 to X67 |
| E8R | Input: 4 points | X20 to X23 | X40 to X43 | X60 to X63 |
|  | Output: 4 points | Y20 to Y23 | Y40 to Y43 | Y60 to Y63 |
| E8YR/E8YT/E8YP | Output: 8 points | Y20 to Y27 | Y40 to Y47 | Y60 to Y67 |
| E16X | Input: 16 points | X20 to X2F | X40 to X4F | X60 to X6F |
| E16R/E16T/E16P | Input: 8 points | X20 to X27 | X40 to X47 | X60 to X67 |
|  | Output: 8 points | Y20 to Y27 | Y40 to Y47 | Y60 to Y67 |
| E16YT/E16YP | Output: 16 points | Y20 to Y2F | Y40 to Y4F | Y60 to Y6F |
| E32T/E32P | Input: 16 points | X20 to X2F | X40 to X4F | X60 to X6F |
|  | Output: 16 points | Y20 to Y2F | Y40 to Y4F | Y60 to Y6F |

12-8

## Analog I/O Unit

The I/O allocations of the analog I/O unit are determined by the position at which the unit is installed.

| Type |  | First expansion | Second <br> expansion | Third expansion |
| :--- | :--- | :--- | :--- | :--- |
| A21 | Input: CH0 16 points | WX2 (X20 to X2F) | WX4 (X40 to X4F) | WX6 (X60 to X6F) |
|  | Input: CH1 16 points | WX3 (X30 to X3F) | WX5 (X50 to X5F) | WX7 (X70 to X7F) |
|  | Output: 16 points | WY2 (Y20 to Y2F) | WY4 (Y40 to Y4F) | WY6 (Y60 to Y6F) |

## A/D Converter Unit and Thermocouple Unit

The data of each channel switches and then reads or writes by the user program which contains the conversion data switch flag.

| Type |  | First expansion | Second <br> expansion | Third expansion |
| :--- | :--- | :--- | :--- | :--- |
| A80, <br> TC4, <br> TC8 | Input: CH0, 2, 4, 6 16 points | WX2 (X20 to X2F) | WX4 (X40 to X4F) | WX6 (X60 to X6F) |
|  | Input: CH1, 3, 5, 7 16 points | WX3 (X30 to X3F) | WX5 (X50 to X5F) | WX7 (X70 to X7F) |

## D/A Converter Unit

The data of each channel switches and then reads or writes by the user program which contains the conversion data switch flag.

| Type |  | First expansion | Second <br> expansion | Third expansion |
| :--- | :--- | :--- | :--- | :--- |
| A04V <br> A04I | Input: $\mathbf{1 6}$ points | WX2 (X20 to X2F) | WX4 (X40 to X4F) | WX6 (X60 to X6F) |
|  | Output: CH0, 2, 16 points | WY2 (Y20 to Y2F) | WY4 (Y40 to Y4F) | WY6 (Y60 to Y6F) |
|  | Output: $\mathbf{C H 1 , ~ 3 , 1 6 ~ p o i n t s ~}$ | WY3 (Y30 to Y3F) | WY5 (Y50 to Y5F) | WY7 (Y70 to Y7F) |

## I/O Link Unit

The I/O allocation of the I/O link unit is determined by order of connection.

| Type |  | First expansion | Second <br> expansion | Third expansion |
| :--- | :--- | :--- | :--- | :--- |
| IOL | Input: 32 points | X 20 to X3F | X 40 to X5F | X 60 to X7F |
|  | output: 32 points | Y 20 to Y3F | Y 40 to Y5F | Y 60 to Y7F |

## RTD Unit

| Type |  | First expansion | Second <br> expansion | Third expansion |
| :--- | :--- | :--- | :--- | :--- |
| RTD6 | Input CH0, 2, 4: 16 points | WX2 (X20 to X2F) | WX4 (X40 to X4F) | WX6 (X60 to X6F) |
|  | Input CH1, 3, 5: 16 points | WX3 (X30 to X3F) | WX5 (X50 to X5F) | WX7 (X70 to X7F) |
|  | Output: 16 points | WY2 (Y20 to Y2F) | WY4 (Y40 to Y4F) | WY6 (Y60 to Y6F) |

## Note

Please verify with the manual for the FPO CC-Link slave unit.

## Expression of numbers for input/output relays

Since input/output relays X and Y are handled in units of 16 points, they are expressed as a combination of decimal and hexadecimal numbers as shown below.

## Example: External input relay "X"

```
X 0,X 1
X F
```

```
X 20,X 21..................... X 2F
    to to to
X 70,X 71..................... X 7F
```

### 12.3 Relays, Memory Areas and Constants

| Item |  | Numbering |  |  | Function |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\begin{aligned} & \mathrm{C} 10 / \mathrm{C} 14 / \\ & \mathrm{C} 16 \end{aligned}$ | C32/SL1 | T32 |  |
| Relays | External input relay | 208 points (X0 to X12F) |  |  | Turns on or off based on external input. |
|  | External out- $\quad$ Y put relay | 208 points (Y0 to Y12F) |  |  | Externally outputs on or off state. |
|  | Internal relay $\quad$ R (* Note 1) | $\begin{aligned} & \text { 1,008 points } \\ & \text { (R0 to R62F) } \end{aligned}$ |  |  | Relay which turns on or off only within program. |
|  | Timer  <br> (* Note 1) T | 144 points <br> (T0 to T99/C100 to C143) <br> (* Note 2) |  |  | If a TM instruction has timed out, the contact with the same number turns on. |
|  | $\begin{aligned} & \text { Counter } \\ & \text { (* Note 1) } \end{aligned}$ |  |  |  | If a CT instruction has counted up, the contact with the same number turns on. |
|  | Special internal relay | 64 points (R9000 to R903F) |  |  | Relay which turns on or off based on specific conditions and is used as a flag. |
| Memory Areas | External input WX relay | 13 words (WX0 to WX12) |  |  | Code for specifying 16 external input points as one word (16 bits) of data. |
|  | External output WY relay | 13 words (WY0 to WY12) |  |  | Code for specifying 16 external output points as one word (16 bits) of data. |
|  | $\begin{aligned} & \text { Internal relay } \quad \text { WR } \\ & \text { (* Note 1) } \end{aligned}$ | 63 words (WR0 to WR62) |  |  | Code for specifying 16 internal relay points as one word (16 bits) of data. |
|  | Data register <br> (* Note 1) | 1,660 words (DT0 to DT1659) | 6,144 words (DT0 to DT6143) | 16,384 words (DT0 to DT16383) | Data memory used in program. Data is handled in 16-bit units (one word). |
|  | Timer/Counter SV set value area (* Note 1) | 144 words (SV0 to SV143) |  |  | Data memory for storing a target value of a timer and an initial value of a counter. Stores by timer/counter number. |
|  | $\begin{aligned} & \text { Timer/Counter EV } \\ & \text { elapsed value area } \\ & \text { (* Note 1) } \end{aligned}$ | 144 words <br> (EV0 to EV143) |  |  | Data memory for storing the elapsed value during operation of a timer/counter. Stores by timer/counter number. |
|  | Special data DT register | 112 words (DT9000 to DT9111) |  | 112 words (DT90000 to DT90111) | Data memory for storing specific data. Various settings and error codes are stored. |
|  | Index register IX <br>  IY | 2 words (IX, IY) |  |  | Register can be used as an address of memory area and constants modifier. |
| Control instruction point | Master control relay points (MCR) | 32 points |  |  |  |
|  | Number of labels (JP and LOOP) | 64 labels |  | 255 labels | $\bar{I}$ |
|  | Number of step ladders | 128 stages |  | 704 stages <br> (* Note 1) |  |
|  | Number of subroutines | 16 subroutines |  | 100 subroutines |  |
|  | Number of interrupt programs | 7 programs (external 6 points, internal 1 point) <br> SL1: 1 program (internal 1 point) |  |  | - |

### 12.3 Relays, Memory Areas and Constants

| Item |  |  | Numbering |  |  | Function |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | $\begin{aligned} & \text { C10/C14/ } \\ & \text { C16 } \end{aligned}$ | C32/SL1 | T32 |  |
| Constant | Decimal constants | K | K-32768 to K32767 (for 16-bit operation) |  |  |  |
|  |  |  | K-2147483648 to K2147483647 (for 32-bit operation) |  |  |  |
|  | Hexadecimal constants | H | H0 to HFFFF (for 16-bit operation) |  |  |  |
|  |  |  | H0 to HFFFFFFFF (for 32-bit operation) |  |  |  |

1) There are two unit types, the hold type that saves the conditions that exist just before turning the power off or changing from the RUN mode to PROG. mode, and the non-hold type that resets them. These areas can be specified as hold type or non-hold type by setting system register. For the FPO T32, the selection of hold type and non-hold type can be changed by the setting of system register. For the FP0 C10/C14/C16/C32/SL1, that area is fixed and allotted the numbers as shown below.

Hold type and non-hold type areas

| Item |  | C10/C14/C16 | C32/SL1 |
| :---: | :---: | :---: | :---: |
| Timer |  | Non-hold type: All points |  |
| Counter | Non-hold type | From the set value to C139 | From the set value to C127 |
|  | Hold type | 4 points (elapsed values) (C140 to C143) | 16 points (elapsed values) C128 to C143 |
| Internal relay | Non-hold type | 976 points <br> (R0 to R60F) <br> 61 words (WR0 to WR60) | 880 points (R0 to R54F) <br> 55 words (WR0 to WR54) |
|  | Hold type | 32 points (R610 to R62F) 2 words (WR61 to WR62) | 128 points (R550 to R62F) 8 words (WR55 to WR62) |
| Data register | Non-hold type | 1652 words <br> (DT0 to DT1651) | 6112 words (DT0 to DT6111) |
|  | Hold type | 8 words (DT1652 to DT1659) | 32 words (DT6112 to DT6143) |

2) The points for the timer and counter can be changed by the setting of system register 5 . The number given in the table are the numbers when system register 5 is at its default setting.

### 12.4 FPO-SL1 S-LINK Address

### 12.5 Specification: Power Supply Unit I/O Link Unit

### 12.5.1 FPO Power Supply Unit (AFP0634)

| Item |  | Specification |
| :--- | :--- | :--- |
| Input | Rated operating voltage | 100 to 240 V AC |
|  | Operating voltage range | 85 to 264 V AC |
|  | Frequency | $50 / 60 \mathrm{~Hz}$ |
|  | Rated frequency | 47 to 63 Hz |
|  | phase | Single-phase |
|  | Inrush current | $30 \mathrm{~A} \mathrm{(0-p)} \mathrm{or} \mathrm{less} \mathrm{(Cold} \mathrm{start)}$ |
|  | Leakage current | 0.75 mA |
|  | Holding time | 10 ms |
| Regulput | Rated output | $24 \mathrm{~V}( \pm 5 \%) \mathrm{DC}$ 0.7A |
|  | Rated output current | 0 to 0.7 A |
|  | Output ripple | $500 \mathrm{mV}(\mathrm{p}-\mathrm{p})$ or less |
| Life time | Over Current Regulation | 0.74 A |
|  | Over Voltage Regulation | Available |

### 12.5.2 FPO I/O Link Unit (AFP0732)

| Item | Specification |
| :--- | :--- |
| Communication method | Two-line, half-duplex |
| Synchronous method | A synchronization system |
| Transmission line | Twisted cables <br> (Twisted pair cable or VCTF Min. 0.75mm² *2C(JIS)) |
| Transmission distance (Total length) | Max. 700m (Twisted pair cable) <br> Max. 400m (VCTF) |
| Baud rate | 0.5 Mbps |
| Number of I/O points per one I/O <br> Link unit | 64 points Note) (Input 32 point + Output 32 point) |
| I/O map of FPO I/O Link Unit | $32 \mathrm{X} / 32 \mathrm{Y}$ |
| Interface | RS485 |
| Communication error check method | CRC (Cyclic Redundancy Check) |

## Note

This number is the number of points that I/O link is available through the host PLC and the network MEWNET-F. In the case I/O Link error flag is on (valid), Number of I/O points are 63 points. (Input 31 points + Output 32 points)

### 14.1 System Registers / Special Internal Relays / Special Data Registers

## Precation for System Registers

## What is the system register area

- System registers are used to set values (parameters) which determine operation ranges and functions used. Set values based on the use and specifications of your program.
- There is no need to set system registers for functions which will not be used.

## Type of system registers

The registers to be used depend on each PLC.
(1) Allocation of user memory (System registers 0, 1 and 2)

These registers set the size of the program area and file register area, allowing the user memory area to be configured for the environment used. The size of the memory area will vary depending on the type.
(2) Allocation of timers and counters (System register 5)

The number of timers and counters is set by specifying the starting counter number.
(3) Hold/non-hold type setting (System registers 6 to 18)

When these registers are set to "hold type", the values in the relays and data memory will be retained even if the system is switched to PROG. mode or the power is turned off. If set to "non-hold type", the values will be cleared to " 0 ".
(4) Operation mode setting on error (System registers 4, 20 to 28)

Set the operation mode when errors such as battery error, duplicated use of output, I/O verification error and operation error occur.
(5) Time settings (System registers 30 to 34)

Set time-out error detection time and the constant scan time.
(6) Remote I/O operation settings (System registers 35 and 36)

These registers are used to select whether or not to wait for a slave station connection when the remote I/O is started, and the remote I/O update timing.
(7) MEWNET-WO/MEWNET-W/P PLC link settings (System registers 40 to 47,50 to 55, and 57)

These settings are for using link relays and link registers for MEWNET-W0/MEWNET-W/P PC(PLC) link communication.
Note) The default value setting is "no PC(PLC) link communication".
(8) MEWNET-H PC(PLC) link settings (System register 49)

Set the data size to be processed during one scan in the MEWNET-H PC(PLC) link communication.
(9) Input settings (System registers 400 to 406)

When using the high-speed counter function, pulse catch function or interrupt function, set the operation mode and the input number to be used for the function.
(10) Input time constant settings (FP1/FP-M System registers 404 to 407)

Changing the input signal width to be loaded enables to prevent the malfunctions caused by chattering or noises.
(11) Number of temperature input averaging process settings (System register 409)

The number of averaging times can be set in order to even out the variation in the input thermocouple values. For normal use it, set the number of times to t least twenty. For default value " 0 ", the number of average processing times is 20 .
(12) Tool and COM. ports communication settings (System registers 410 to 421)

Set these registers when the Tool port,and COM1 and COM2 ports are to be used for computer link, general-purpose serial communication, PC(PLC) link, and modem communication.Note that the default setting is computer link mode.

## Checking and changing the set value of system register

If you are going to use a value which is already set(the value which appears when read), there is no need write it again.

## Using programming tool software <br> Produce:

1. Set the control unit in the PROG mode.
2.Option ->PLC Configuration
2. When the function for which setting are to be entered is selected in the PLC Configuration dialog box, the value and setting status for the selected system register are displayed.
To change the value and setting status, write in the new value and /or select the setting status.
4.To register these settings,choose OK

## Precautions for system register setting

-System register settings are effective from the time they are set.
However, input settings,tool port,COM port,and modem connection settings become effective when the mode is changed from PROG. to RUN. With regard to the modem connection setting, when the power is turned off and on or when the mode is changed from PROG. to RUN, the controller sends a command to the modem which enables it for reception.
-When the initialized operation is performed, all set system register values (parameters) will be initialized

### 14.1.1 Table of System Registers for FP0

## Content of system register settings

## 1. Setting the timers and counters (System register 5)

By indicating the counter start number, the timer and counter are split into two areas. The timer and counter together total 144 points, and the default value for th split is 100 . Thus the point allotment is as shown in the table below.

| Timer | 100 points (No. 0 to No. 99) |
| :--- | :--- |
| Counter | 44 points (No. 100 to No. 143) |

## Setting example

To increase the number of timers to 120, change the value of system register 5 to K120.

For T32, set the system registers 5 and 6 to the same value. This sets the timer to a non-hold type and counter to a hold type.

By setting system register 5 to " 0 ", the whole area becomes the counter. Also, by setting it to the value " 144 ", the whole area becomes the timer.

## 2. Hold types and non-hold type settings (System registers 6 to 8 and 14)

With the C10/C14/C16/C32/SL1, the areas held in the event of a power supply interruption are fixed at the areas shown in the table below, and the settings for system registers 6 to 8 and 14, will be invalid.

C10/C14/C16

| Timer | Non-hold type: All points |
| :--- | :--- |
| Counter | Non-hold type: From the set value to C139 |
|  | Hold type: 4 points (elapsed values )C140 to C143 |
|  | Non-hold type:976 points (R0 to R60F) <br> 61 words (WR0 to WR60) |
|  | Hold type:32 points (R610 to R62F) <br> 2 words (WR61 to WR62) |
| Data register | Non-hold type: 1652 words (DT0 to DT1651) |
|  | Hold type: 8 words (DT1652 to DT1659) |

C32/SL1

| Timer | Non-hold type: All points |
| :--- | :--- |
| Counter | Non-hold type: From the set value to C127 |
|  | Hold type: 16 points (elapsed values )C128 to C143 |
|  | Non-hold type:880 points (R0 to R54F) <br> 55 words (WR0 to WR54 |
|  | Hold type:128 points (R550 to R62F) <br> 8 words (WR55 to WR62) |
| Data register | Non-hold type: 6112 words (DT0 to DT6111) |
|  | Hold type: 32 words (DT6112 to DT6143) |

With the T32, set each relay and register to a hold type or non-hold type.

For normal situations, set the system registers 5 and 6 to the same value. This sets the timer to a nonhold type and counter to a hold type.
By setting this value to " 0 ", the whole area becomes hold type. Also, by setting it to the valeu 1 higher than the last number, the whold area becomes non-hold type.

C32/SL1

| Type | T32 |
| :--- | :--- |
| Timer | All non-hold type |
| Counter | All hold type |
| Internal <br> relay | Non-hold type |
|  | Hold type | Non-hold type: 10 words (WR0 to WR9)

## 14-6

Phone: 800.894.0412-Fax: 888.723.4773-Web: www.ctiautomation.net - Email: info@ctiautomation.net

Table of system registers
C10, C14, C16, C32, T32 and SL1 in the table respectively indicate 10-point, 14-point, 16-point, 32-point type and S-LINK type FPO control units.

| Item | Address | Name | Default value | Descriptions |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

Note) The setting values of the system registers No. 6, 7, 8 and 14 becomes invalid with the types other than T32.

| Item | Address | Name |  | Default value |  | Descriptions |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Time setting | 31 | Wait time setting for multi-frame communication |  | $\begin{aligned} & 6500 \mathrm{~ms} \\ & (\mathrm{~K} 2600) \end{aligned}$ | 10 ms to 81900 ms (K4 to K32760) Used of default setting (K2600/6500 ms ) is recommended. |  |
|  | 34 | Constant va for scan tim | ue settings | $\begin{aligned} & 0 \mathrm{~ms} \\ & (\mathrm{KO}) \end{aligned}$ | 2.5 once 0 (K <br> set $v$ | ms to 160 ms (K1 to K64 ): Scans each specified time interval. ):Normal scan <br> lue $\times 2.5 \mathrm{~ms}=$ Constant value setting for multi-frame communication (ms) <br> In programming tool software, enter the time (a number divisible by 2.5 ). <br> In FP Programmer II, enter the set value (equal to the time divided by 2.5 ). |
| Input setting | 400 | High-speed counter mode settings (X0 to X2) | Setting by programming tool software | Do not set XO as highspeed counter. | CHO | ```Do not set XO as high-speed counter. 2-phase input ( \(\mathrm{XO}, \mathrm{X} 1\) ) 2-phase input ( \(\mathrm{X} 0, \mathrm{X1}\) ), Reset input (X2) Incremental input (X0) Incremental input (X0), Reset input (X2) Decremental input (X0) Decremental input (X0), Reset input (X2) Individual input ( \(\mathrm{X0} 0, \mathrm{X} 1\) ) Individual input ( \(\mathrm{X0}, \mathrm{X} 1\) ), Reset input (X2) Direction decision ( \(\mathrm{X0}, \mathrm{X} 1\) ) Direction decision ( \(\mathrm{X} 0, \mathrm{X} 1\) ), Reset input (X2)``` |
|  |  |  |  | Do not set X 1 as highspeed counter. | CH1 | Do not set X 1 as high-speed counter. <br> Incremental input (X1) <br> Incremental input (X1), Reset input (X2) <br> Decremental input (X1) <br> Decremental input (X1), Reset input (X2) |

Note1) If the operation mode is set to 2-phase, individual, or direction differentiation, the setting for CH 1 is invalid.
Note2) If reset input settings overlap, the setting of CH 1 takes precedence.
Note3) If system register 400 to 403 have been set simultaneously for the same input relay, the following precedence order is effective: [High-speed counter] '[Pulse catch]' [Interrupt input].

FPO

Note1) If the operation mode is set to 2-phase, individual, or direction differentiation, the setting for CH 1 is invalid.
Note2) If reset input settings overlap, the setting of CH1 takes precedence.
Note3) If system register 400 to 403 have been set simultaneously for the same input relay, the following precedence order is effective: [High-speed counter] '[Pulse catch]' [Interrupt input].

Note1) If the operation mode is set to 2-phase, individual, or direction differentiation, the setting for CH3 is invalid.
Note2) If reset input settings overlap, the setting of CH 3 takes precedence.
Note3) If system register 400 to 403 have been set simultaneously for the same input relay, the following precedence order is effective: [High-speed counter] '[Pulse catch]' [Interrupt input].

## FPO

Note1) With the TOOL software, " 0 " or " 1 " is set for each bit on the screen in the setting for system register 403.
Note2) If system register 400 to 403 are set simultaneously for the same inptu relay, the following precedence order is effective:
[High-speed counter] '[Pulse catch]' [Interrupt input].
When the high-speed counter is being used in the incremental input mode, even if input X0 is specified as an interrupt input and as pulse catch input, those settings are invalid, and input X0 functions as counter input for the high-speed counter.
No. 400: H1 a This setting will be valid. No. 402: H1 No. 403: H1

### 14.1.2 Table of Special Internal Relays for FPO

The special internal relays turn on and off under special conditions. The on and off states are not output externally. Writing is not possible with a programming tool or an instruction.

## FPO

| Address | Name | Description |
| :---: | :---: | :---: |
| R9000 | Self-diagnostic error flag | Turns on when a self-diagnostic error occurs. The self-diagnostic error code is stored in DT9000. |
| $\begin{aligned} & \text { R9001 to } \\ & \text { R9003 } \end{aligned}$ | Not used | - |
| R9004 | I/O verification error flag | Turns on when an I/O verification error occurs. <br> The position number of the I/O where the verification error was occurred is stored in DT9010. |
| $\begin{aligned} & \text { R9005, } \\ & \text { R9006 } \end{aligned}$ | Not used | - |
| R9007 | Operation error flag (hold) | Turns on and keeps the on state shen an operation error occurs. <br> The address where the error occurred is stored in DT9017. (Indicates the first operation error which occurred). |
| R9008 | Operation error flag (non-hold) | Turns on for an instant when an operation error occurs. The address where the operation error occurred is stored in DT9018. The contents change each time a new error occurs. |
| R9009 | Carry flag | Turns on for an instant, <br> - when an overflow or underflow occurs. <br> - when " 1 " is set by one of the shift instructions. |
| R900A | > Flag | Turns on for an instant when the compared results become larger in the "F60 (CMP) to F63 (DWIN) comparison instructions." |
| R900B | $=$ Flag | Turns on for an instant, <br> - when the compared results are equal in the comparison instructions (F60 to F63). <br> - when the calculated results become 0 in the arithmetic instructions. |
| R900C | < Flag | Turns on for an instant when the compared results become smaller in the "F60 (CMP) to F63 (DWIN) comparison instructions. |
| R900D | Auxiliary timer contact | Turns on when the set time elapses (set value reaches 0 ) in the timing operation of the F137(STMR)/F183(DSTM) auxiliary timer instruction. <br> It turns off when the trigger for auxiliary timer instruction turns off. |
| R900E | Tool port error flag | This turns on when an error occurs during communication with a programming tool. |
| R900F | Constant scan error flag | Turns on when the scan time exceeds the time specified in system register 34 during constant scan execution. |
| R9010 | Always on relay | Always on. |
| R9011 | Always off relay | Always off. |
| R9012 | Scan pulse relay | Turns on and off alternately at each scan. |

| FPO |  |  |
| :---: | :---: | :---: |
| Address | Name | Description |
| R9013 | Initial on pulse relay | Turns on only at the first scan in the operation. <br> Turns off from the second scan and maintains the off state. |
| R9014 | Initial off pulse relay | Turns off only at the first scan in the operation. <br> Turns on from the second scan andmaintains the on state. |
| R9015 | Step ladder initial on pulse relay | Turns on for an instant only in the first scan of the process the moment step ladder process is opened. |
| $\begin{aligned} & \text { R9016, } \\ & \text { R9017 } \end{aligned}$ | Not used | - |
| R9018 | 0.01 s clock pulse relay | Repeats on/off operations in 0.01 s cycles. |
| R9019 | 0.02 s clock pulse relay | Repeats on/off operations in 0.02 s cycles. |
| R901A | 0.1 s clock pulse relay | Repeats on/off operations in 0.1 s cycles. |
| R901B | 0.2 s clock pulse relay | Repeats on/off operations in 0.2 s cycles. |
| R901C | 1 s clock pulse relay | Repeats on/off operations in 1 s cycles. |
| R901D | 2 s clock pulse relay | Repeats on/off operations in 2 s cycles. |
| R901E | 1 min clock pulse relay | Repeats on/off operations in 1 min cycles. |
| R901F | Not used | - |
| R9020 | RUN mode flag | Turns off while the mode selector is set to PROG. Turns on while the mode selector is set to RUN. |
| $\begin{aligned} & \text { R9021 to } \\ & \text { R9025 } \\ & \hline \end{aligned}$ | Not used | - |
| $\begin{aligned} & \text { R9026 } \\ & \text { (*Note) } \end{aligned}$ | Message flag | Turns on while the F149 (MSG) instruction is executed. |
| $\begin{aligned} & \text { R9027 } \\ & \text { (*Note) } \end{aligned}$ | Remote mode flag | Turns on while the mode selector is set to REMOTE. |
| R9028 | Not used | - |

Note) Used by the system.

FPO

| Address | Name |  | Description |
| :---: | :---: | :---: | :---: |
| R9029 (*Note) | Forcing flag |  | Turns on during forced on/off operation for input/output relay timer/counter contacts. |
| R902A (*Note) | External interrupt enable flag |  | Turns on while the external interrupt trigger is enabled by the ICTL instruction. |
| R902B (*Note) | Interrupt error flag |  | Turns on when an interrupt error occurs. |
| R902C to R902F | Not used |  | - |
| $\begin{aligned} & \hline \text { R9030, } \\ & \text { R9031 } \end{aligned}$ | Not used |  | - |
| R9032 | RS232C port mode flag |  | When "General-use port" is selected, "K2" goes on. |
| R9033 | Printout instruction flag |  | Turns on while a F147 (PR) instruction is executed. Turns off when a F147 (PR) instruction is not executed. |
| R9034 | Rewrite during RUN flag |  | This is a special internal relay that goes on for only the first scan following the completion of rewriting in the RUN mode. (CPU Ver. 2.1 or later available) |
| R9035 | S-LINK I/O communication error flag |  | Turns on when the S-LINK error (ERR 1, 3 or 4) occurs using S-LINK system. |
| R9036 | S-LINK communication status flag |  | Turns on when communication is taking place with an SLINK input/Ooutput unit. |
| R9037 | RS232C communication error flag |  | Turns on when the serial data communication error occurs. |
| R9038 | RS232C reception completed flag |  | Turns on when a terminator is received during the serial data communicating. |
| R9039 | RS232C transmission completed flag |  | Turns on while data is not send during the serial data communicating. <br> Turns off while data is being sent during the serial data communicating. |
| R903A | High-speed counter control flag | ch0 | Turns on while the high-speed counter instructions F166(HC1S) to F170(PWM) are executed. |
| R903B | High-speed counter control flag | ch1 | Turns on while the high-speed counter instructions F166(HC1S) to F170(PWM) are executed. |
| R903C | High-speed counter control flag | ch2 | Turns on while the high-speed counter instructions F166(HC1S) to F170(PWM) are executed. |
| R903D | High-speed counter control flag | ch3 | Turns on while the high-speed counter instructions F166(HC1S) to F170(PWM) are executed. |
| R903E, R903F | Not used |  | - |

Note) Used by the system.

### 14.1.3 Table of Special Data Registers for FPO

The special data registers are one word (16-bit) memory areas which store specific information. With the exception of registers for which "Writing is possible" is indicated in the "Description" column, these registers cannot be written to.

| Address |  | Name | Descriptions |
| :---: | :---: | :---: | :---: |
| FP0 T32 | $\begin{array}{\|l\|} \hline \text { FP0 C10, } \\ \text { C14, C16, } \\ \text { C32, SL1 } \\ \hline \end{array}$ |  |  |
| DT90000 | DT9000 | Self-diagnostic error code | The self-diagnostic error code is stored here when a self-diagnostic error occurs. Monitor the error code using decimal display. |
| DT90010 | DT9010 | I/O verify error unit | The position of the I/O for which an error occurred is stored in bits 0 to 3 . |
| DT90014 | DT9014 | Auxiliary register for operation | One shift-out hexadecimal digit is stored in bit positions 0 to 3 when F105 (BSR) or F106 (BSL) instruction is executed. |
| DT90015 | DT9015 | Auxiliary register for operation | The divided remainder (16-bit) is stored in DT9015/DT90015 when F32(\%) or F52(B\%) instruction is executed. <br> The divided remainder (32-bit) is stored in DT9015 and DT9016/DT90015 and DT90016 when F33(D\%) or F53(DB\%) instruction is executed. |
| DT90016 | DT9016 |  |  |
| DT90017 | DT9017 | Operation error address (hold) | After commencing operation, the address where the first operation error occurred is stored. Monitor the address using decimal display. |
| DT90018 | DT9018 | Operation error address (non-hold) | The address where an operation error occurred is stored. Each time an error occurs, the new address overwrites the previous address. At the beginning of scan, the address is 0 . Monitor the address using decimal display. |
| DT90019 | DT9019 | 2.5 ms ring counter | The data stored here is increased by one every 2.5 ms . (HO to HFFFF) <br> Difference between the values of the two points (absolute value) $\times 2.5 \mathrm{~ms}=$ Elapsed time between the two points. |

| Address |  | Name | Descriptions |
| :---: | :---: | :---: | :---: |
| FP0 T32 | $\begin{aligned} & \text { FP0 C10, } \\ & \text { C14, C16, } \\ & \text { C32, SL1 } \end{aligned}$ |  |  |
| - | DT9020 <br> (Availabl <br> e type: <br> SL1) | S-LINK status flag/error flag | (1: Short-circuit between D and G) <br> Notes <br> - ERR1 and ERR3 occur even if the power supply on the S-LINK side is interrupted, but are canceled when the power supply is turned on again. <br> - ERR4 is held. To cancel it, repair the disconnected wire in the S-LINK syste, or whatever iscausing the problem, and then either turn the power to the FPO on again, press the SET switch to reset it, or turn the power supply on again on the S-LINK unit side. |

| Address |  | Name | Descriptions |
| :---: | :---: | :---: | :---: |
| FP0 T32 | $\begin{aligned} & \text { FP0 C10, } \\ & \text { C14, C16, } \\ & \text { C32, SL1 } \end{aligned}$ |  |  |
| - | DT9021 <br> (Availabl e type: SL1) | No. of units connected to S-LINK/error address | (When normal) <br> Note <br> - When the SET switch is pressed, the number of input/output units connected to the S-LINK system is set. <br> (If the same address has been specified for multiple units, the units are counted as a single unit. This is invalid, however, if an ERR4 error is in progress.) <br> (If ERR4 occurs) |
| DT90022 | DT9022 | Scan time (current value) <br> (*Note) | The current scan time is stored here. Scan time is calculated using the formula: <br> Scan time (ms) = stored data (decimal) $\times 0.1$ K50 indicates 5 ms . |

Scan time display is only possible in RUN mode, and shows the operation cycle time. The maximum and minimum values are cleared when each the mode is switched between RUN mode and PROG. mode.

| Address |  | Name | Descriptions |
| :---: | :---: | :---: | :---: |
| FP0 T32 | $\begin{aligned} & \hline \text { FP0 C10, } \\ & \text { C14, C16, } \\ & \text { C32, SL1 } \\ & \hline \end{aligned}$ |  |  |
| DT90023 | DT9023 | Scan time (minimum value) (*Note1) | The minimum scan time is stored here. Scan time is calculated using the formula: Scan time (ms) = stored data (decimal) $\times 0.1 \mathrm{~ms}$ Example: K50 indicates 5 ms . |
| DT90024 | DT9024 | Scan time (maximum value) (*Note 1) | The maximum scan time is stored here. The scan time is calculated using the formula: Scan time (ms) = stored data (decimal) $\times 0.1 \mathrm{~ms}$ Example: K125 indicates 12.5 ms . |
| DT90025 (*Note2) | DT9025 (*Note2) | Mask condition monitoring register for interrupts (INT 0 to 5) | The mask conditions of interrupts using ICTL instruction can be monitored here. Monitor using binary display. |
| DT90026 | DT9026 | Not used | - |
| DT90027 (*Note2) | DT9027 <br> (*Note2) | Periodical interrupt interval (INT24) | The value set by the ICTL instruction is stored. KO: periodical interrupt is not used. <br> K1 to K3000: 10ms to 30s |
| DT90028 | DT9028 | Not used | - |
| DT90029 | DT9029 | Not used | - |
| DT90030 (*Note2) | DT9030 (*Note2) | Character storage by F149 MSG instruction | The contents of the specified message are stored in these special data registers when F149 (MSG) instruction is executed. |
| DT90031 (*Note2) | $\begin{array}{\|l} \hline \text { DT9031 } \\ \text { (*Note2) } \end{array}$ |  |  |
| DT90032 <br> (*Note2) | DT9032 <br> (*Note2) |  |  |
| DT90033 (*Note2) | DT9033 <br> (*Note2) |  |  |
| DT90034 (*Note2) | $\begin{array}{\|l} \hline \text { DT9034 } \\ \text { (*Note2) } \end{array}$ |  |  |
| DT90035 (*Note2) | DT9035 <br> (*Note2) |  |  |
| DT90036 | DT9036 | Not used | - |
| DT90037 | DT9037 | Work 1 for F96 (SRC) instruction | The number of data that match the searched data is stored here when F96 (SRC) instruction is executed. |

Note1) Scan time display is only possible in RUN mode and shows the operation cycle time. The maximum and minimum values are cleared when each mode is switched between RUN mode and PROG. mode.
Note2) Used by the system.

| Address |  | Name | Descriptions |
| :---: | :---: | :---: | :---: |
| FP0 T32 | $\begin{aligned} & \text { FP0 C10, } \\ & \text { C14, C16, } \\ & \text { C32, SL1 } \\ & \hline \end{aligned}$ |  |  |
| DT90038 | DT9038 | Work 2 for F96 (SRC) instruction | The position of the first matching data, counting from the starting 16-bit area, is stored here when an F96 (SRC) instruction is executed. |
| DT90039 to DT90043 | $\begin{aligned} & \hline \text { DT9039 } \\ & \text { to } \\ & \text { DT9043 } \end{aligned}$ | Not used | - |
| DT90044 | DT9044 | High-speed counter elapsed value for ch0 (*Note1) | The elapsed value (24-bit data) for the highspeed counter is stored here. Each time the ED instruction is executed, the elapsed value for the high-speed counter is automatically transferred to the special registers DT9044 and DT9045/DT90044 and DT90045. <br> The value can be written by executing F1 (DMV) instruction. |
| DT90045 | DT9045 |  |  |
| DT90046 | DT9046 | High-speed counter target value for ch0 (*Note1) | The target value (24-bit data) of the high-speed counter specified by the high-speed counter instruction is stored here. <br> Target values have been preset for the various instructions, to be used when the high-speed counter related instruction F166 to F170 is executed. These preset values can only be read, and cannot be written. |
| DT90047 | DT9047 |  |  |
| DT90048 | DT9048 | High-speed counter elapsed value area for ch1 (*Note1) | The elapsed value (24-bit data) for the highspeed counter is stored here. Each time the ED instruction is executed, the elapsed value for the high-speed counter is automatically transferred to the special registers DT9048 and DT9049/DT90048 and DT90049. <br> The value can be written by executing F1 (DMV) instruction. |
| DT90049 | DT9049 |  |  |
| DT90050 | DT9050 | High-speed counter target value area for ch1 (*Note1) | The target value (24-bit data) of the high-speed counter specified by the high-speed counter instruction is stored here. <br> Target values have been preset for the various instructions, to be used when the high-speed counter related instruction F166 to F170 is executed. These preset values can only be read, and cannot be written. |
| DT90051 | DT9051 |  |  |

Note1) In the FP0 compatibility mode of FPOR, it is 32-bit data.

| Address |  | Name | Descriptions |
| :---: | :---: | :---: | :---: |
| FP0 T32 | $\begin{aligned} & \text { FP0 C10, } \\ & \text { C14, C16, } \\ & \text { C32, SL1 } \\ & \hline \end{aligned}$ |  |  |
| DT90052 | DT9052 | High-speed counter control flag | A value can be written with F0 (MV) instruction to reset the high-speed counter, disable counting, stop high-speed counter instruction (F168), and clear the high-speed counter. <br> Software is not reset: HO (0000) <br> Perform software reset: H1 (0001) <br> Disable count: H2 (0010) <br> Disable hardware reset: H4 (0100) <br> Stop pulse output (clear instruction): H8 (1000) <br> Perform software reset and stop pulse output: <br> H9 (1001) <br> The 16 bits of DT9052/DT90052 are allocated in groups of four to high-speed channels 0 to 3 as shown below. <br> A hardware reset disable is only effective when using the reset input (X2 and X5). In all other cases it is ignored. <br> When using pulse output, a hardware reset input is equivalent to an home point proximate input. |
| DT90053 | - | Real-Time Clock (Clock/Calendar) monitor (hour/minute) | Hour and minute data of the Real-Time Clock (Clock/Calendar) are stored here. <br> This data is read-only data; it cannot be overwritten. |

| Address <br> FP0 T32 |  | FP0 C10, <br> C14, C16, <br> C32, SL1 |  |
| :--- | :--- | :--- | :--- |

Note) After discharging the battery (including when the power is turned on for the first time), the values of DT90053 to DT90058 change at random. Once the time and date have been set, these values will function normally.

| Address |  | Name |  | Descriptions |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| FP0 T32 | $\begin{aligned} & \text { FP0 C10, } \\ & \text { C14, C16, } \\ & \text { C32, SL1 } \end{aligned}$ |  |  |  |  |  |  |  |  |
| DT90059 | DT9059 | Serial communication error code |  | ${ }^{\text {DT9059 }} \begin{aligned} & \text { DT90059 } \\ & \text { - Tool port }\end{aligned}$ bit 0=1: <br> bit 1=1: <br> bit 2=1: <br> - RS232C <br> bit 8=1: <br> bit $9=1$ : <br> bit 10=1 |  |  | 4 <br> Error <br> tool p |  | ${ }^{0}$ |
| DT90060 | DT9060 | Step ladder process | Process number: 0 to 15 | Indicates the startup condition of the step ladder process. When the process starts up, the bit corresponding to the process number turns on"1". |  |  |  |  |  |
| DT90061 | DT9061 |  | Process number: 16 to 31 |  |  |  |  |  |  |
| DT90062 | DT9062 |  | Process number: 32 to 47 |  |  |  |  |  |  |
| DT90063 | DT9063 |  | Process number: 48 to 63 | Monitor using binary display. |  |  |  |  |  |
| DT90064 | DT9064 |  | Process number: 64 to 79 |  |  |  |  |  |  |
| DT90065 | DT9065 |  | Process number: 80 to 95 | 1: executing 0: not-executing |  |  |  |  |  |
| DT90066 | DT9066 |  | Process number: 96 to 111 | A programming tool software can be used to write data. |  |  |  |  |  |
| DT90067 | DT9067 |  | Process number: 112 to 127 |  |  |  |  |  |  |

Note1) In the FPO compatibility mode of FPOR, it is 32-bit data.

### 14.2 Table of Basic Instructions

| Name | Boolean | Symbol | Description |  | 는 | 은 | $\left\|\begin{array}{c} \boldsymbol{x} \\ 0 \\ 0 \end{array}\right\|$ | W | $\begin{aligned} & \times \\ & \text { 면 } \end{aligned}$ | N |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Sequence basic instructions |  |  |  |  |  |  |  |  |  |  |  |
| Start | ST |  | Begins a logic operation with a Form A (normally open) contact. | $\begin{gathered} 1 \\ (2) \end{gathered}$ | a | a | a | a | a | a | 0 |
| Start Not | STI |  | Begins a logic operation with a Form B (normally closed) contact. | $\begin{gathered} 1 \\ 1 \\ \text { (2) } \\ \hline \end{gathered}$ | a | a | a | a | a | a | 0 |
| Out | OT | $\stackrel{Y, R L, E}{[i]}$ | Outputs the operated result to the specified output. | $\begin{gathered} 1 \\ 1 \\ (2) \\ \hline \end{gathered}$ | a | a | a | a | a | O | 0 |
| Not | $I$ | /- | Inverts the operated result up to this instruction. | 1 | a | a | a | a | a | a | 0 |
| AND | AN |  | Connects a Form A (normally open) contact serially. | $\begin{gathered} 1 \\ (2) \\ \hline \end{gathered}$ | a | a | a | a | a | a | 0 |
| AND Not | AN/ |  | Connects a Form B (normally closed) contact serially. | $\begin{gathered} 1 \\ (2) \\ \hline \end{gathered}$ | a | a | a | a | a | O | 0 |
| OR | OR | $\stackrel{\text { x, R, , ,C,L, P, },}{\stackrel{1}{2}}$ | Connects a Form A (normally open) contact in parallel. | $\begin{gathered} 1 \\ (2) \end{gathered}$ | a | a | a | a | a | a | 0 |
| OR Not | ORI | $\begin{aligned} & x, R, T, G, L, P, E \\ & \hline \end{aligned}$ | Connects a Form B (normally closed) contact in parallel. | $\begin{gathered} 1 \\ 1 \\ (2) \\ \hline \end{gathered}$ | a | a | a | a | a | a | 0 |
| Leading edge start | ST $\uparrow$ | $\stackrel{X, Y, R, T, C, L, P, E}{ }$ | Begins a logic operation only for one scan when the leading edge of the trigger is detected. | 2 | $\times$ | $\times$ | a | $\stackrel{\Delta}{\star}$ | $\stackrel{\Delta}{*}$ | O | 0 |
| Trailing edge start | ST $\downarrow$ | $\stackrel{X, Y, R, T, C, L, P, E}{ }$ | Begins a logic operation only for one scan when the trailing edge of the trigger is detected. | 2 | $\times$ | $\times$ | a | $\stackrel{\Delta}{\star}$ | $\stackrel{\Delta}{\star}$ | O | 0 |
| Leading edge AND | AN $\uparrow$ | $\stackrel{X, Y, R, T, C, L, P, E}{\mid \uparrow}$ | Connects a Form A (normally open) contact serially only for one scan when the leading edge of the trigger is detected. | 2 | $\times$ | $\times$ | a | $\stackrel{\Delta}{*}$ | $\stackrel{\Delta}{*}$ | O | 0 |
| Trailing edge AND | AN $\downarrow$ | $\xrightarrow[\downarrow, Y, R, T, C, L, P, E]{\downarrow}$ | Connects a Form A (normally open) contact serially only for one scan when the trailing edge of the trigger is detected. | 2 | $\times$ | $\times$ | a | $\stackrel{\Delta}{\star}$ | $\stackrel{\Delta}{*}$ | a | 0 |
| Leading edge $O R$ | OR $\uparrow$ | $\xrightarrow{\text { X, Y, RT, C, L, P, E }}$ \i | Connects a Form A (normally open) contact in parallel only for one scan when the leading edge of the trigger is detected. | 2 | $\times$ | $\times$ | a | $\stackrel{\Delta}{\star}$ | $\stackrel{\Delta}{\star}$ | a | 0 |
| Trailing edge OR | OR $\downarrow$ | $\xrightarrow[\substack{\text { X,Y,RT, C,L, P, } \\\langle\downarrow}]{ }$ | Connects a Form A (normally open) contact in parallel only for one scan when the trailing edge of the trigger is detected. | 2 | $\times$ | $\times$ | a | $\stackrel{\Delta}{\star}$ | $\stackrel{\Delta}{*}$ | a | 0 |
| Leading edge out | OT $\uparrow$ | $\stackrel{P}{[ }[\uparrow]$ | Outputs the operated result to the specified output only for one scan when leading edge of the trigger is detected. (for pulse relay) | 2 | $\times$ | $\times$ | $\times$ | $\times$ | $\times$ | O | 0 |
| Trailing edge out | OT $\downarrow$ | $\begin{array}{c\|} P \\ -\downarrow] \end{array}$ | Outputs the operated result to the specified output only for one scan when trailing edge of the trigger is detected. (for pulse relay) | 2 | $\times$ | $\times$ | $\times$ | $\times$ | $\times$ | O | 0 |
| Alternative out | ALT | $\begin{array}{\|c\|} \substack{Y, R, L, E,} \\ \langle A \\ \hline \end{array}$ | Inverts the output condition (on/off) each time the leading edge of the trigger is detected. | 3 | $\times$ | $\times$ | a | a | a | a | 0 |
| AND <br> stack | ANS | Wけ | Connects the multiple instruction blocks serially. | 1 | a | a | a | a | a | a | 0 |
| OR stack | ORS | $\begin{aligned} & \longmapsto \longmapsto \vdash \\ & \longmapsto \longmapsto \vdash \end{aligned}$ | Connects the multiple instruction blocks in parallel. | 1 | a | a | a | a | a | O | 0 |

*1) This instruction is available for FP-X V1.10 or later and FPE 32k type

### 14.3 Table of High-level Instructions

The high-level instructions are expressed by the prefixes " $F$ " or " $P$ " with numbers. For most of the high-level instructions, " $F$ " and " $P$ " types are available. The differences between the two types are explained as follows:

- Instructions with the prefix " $F$ " are executed in every scan while its trigger is in the on.
- Instructions with the prefix " $P$ " are executed only when the leading edge of its trigger is detected.

For the FP0/FPOR/FPE/FP-X, the P type high-level instructions are not available.

### 14.4 Table of Error codes

## Difference in ERROR display

There are differences in the way errors are displayed depending on the model.

| Model | Display | Display method |  |
| :--- | :--- | :--- | :--- |
| FP1,FP-M,FP2,FP3,FP10SH | LED | ERROR. | Continually lit |
| FP, FP0, FPOR, FP-X | LED | ERROR/ALARM | Flashes/contunually lit |
| FP-e | Screen display | ERR. | Continually lit |

## Error Confirmation When ERROR Turns ON

When the "ERROR" on the control unit (CPU unit) turns on or flashes, a self-diagnostic error or syntax check error has occurred. Confirm the contents of the error and take the appopriate steps.

## -Error Confirmation Method

Procedure:1.Use the programming tool software to call up the error code.
By executing the "STATUS DISPLAY", the error code and content of error are displayed.
2. Check the error contents in the table of error codes using the error code ascertained above.

## -Syntax check error

This is an error detected by the total check function when there is a syntax error or incorrect setting written in the program. When the mode selector is switched to the RUN mode, the total check function automatically activates and eliminates the possibility of incorrect operation from syntax errors in the program.

## When a syntax check error is detected

-ERROR turns on or flashes.
-Operation will not begin even after swirching to the RUN mode.
-Remote operation cannot be used to change to RUN mode.

## Clearing a syntax check error

By changing to the PROG.mode, the error will clear and the ERROR will turn off.

## Steps to take for syntax error

Change to the PROG. mode, and then execute the total check function while online mode with the programming tool connected. This will call up the content of error and the address where the error occurred.
Correct the program while referring to the content of error.

## -Self-diagnostic Error

This error occurs when the control unit (CPU unit) self-diagnostic function detects the occurrence of an abnormality in the system. The self-diagnostic function monitors the memory abnormal detection, I/O abnomal detection, and other devices.

## When a self-diagnostic error occurs

- The ERROR turns on or flashes.
- The operation of the control unit (CPU unit) might stop depending on the contect of error and the system register setting.
- The error codes will be stored in the special data register DT9000(DT90000).
- In the case of operation error, the error address will stored in the DT9017(DT90017) and DT9018(DT90018).

## Clearing the self-diagnostic error

At the "STATUS DISPLAY", execute the "error clear". Error codes 43 and higher can be cleared. -You can use the initialize/test switch to clear an error. However, this will also clear the contents of operation memory.
-Errors can also be cleared by turning off and on the power while in the PROG.mode.
However, the contents of operation memory, not stored with the hold type data, will also be cleared.
-The error can also be cleared depending on the self-diagnostic error set instruction F148(ERR).

## Steps to take for self-diagnostic error

The steps to be taken will differ depending on the error contents. For more details, use the error code obtained above and consult the table of aself-diagnostic error codes.

## MEWTOCOL-COM Transmission Errors

These are error codes from a PC or other computer device that occur during an abnormal response when communicating with a PLC using MEWTOCOL-COM.

## Table of Syntax Check Error

| Error code | Name | Operation status | Description and steps to take | $\begin{aligned} & \text { M } \\ & \text { ì } \end{aligned}$ | 은 | $\begin{aligned} & \text { 증 } \\ & \text { 맨 } \end{aligned}$ | $\begin{aligned} & \text { W } \\ & \text { 묘 } \end{aligned}$ | $\begin{aligned} & x \\ & \text { 는 } \end{aligned}$ | N | T | T N - - |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| E1 | Syntax error | Stops | A program with a syntax error has been written. <br> $\Rightarrow$ Change to PROG. mode and correct the error. | A | A | A | A | A | A | A | A |
| $\underset{\text { (Note) }}{\text { E2 }}$ | Duplicated output error | Stops | Two or more OT(Out) instructions and KP(Keep) instructions are programmed using the same relay.Also occurs when using the same timer/counter number. <br> $\Rightarrow$ Change to PROG. mode and correct the program so that one relay is not used for two or more OT instructions, Or, set the duplicated output to "enable" in system register20. A timer/counter instructon double definition error will be detected even if double output permission has been selected. | A | A | A | A | A | A | A | A |
| E3 | Not paired error | Stops | For instructions which must be used in a pair such as jump (JP and LBL), one instruction is either missing or in an incorrect position. <br> $\Rightarrow$ Change to PROG. mode and enter the two instructions which must be used in a pair in the correct positions. | A | A | A | A | A | A | A | A |
| E4 | Parameter mismatch error | Stops | An instruction has been written which does not agree with system register settings. For example, the number setting in a program does not agree with the timer/counter range setting. <br> $\Rightarrow$ Change to PROG. mode, check the system register settings, and change so that the settings and the instruction agree. | A | A | A | A | A | A | A | A |
| $\begin{gathered} \text { E5 } \\ \text { (Note) } \end{gathered}$ | Program area error | Stops | An instruction which must be written in a specific area (main program area or subprogram area) has been written to a different area (for example, a subroutine SUB to RET is placed before an ED instruction). $\Rightarrow$ Change to PROG. mode and enter the instruction into the correct area. | A | A | A | A | A | A | A | A |

A:Available
Note) This error is also detected if you attempt to execute a rewrite containing a syntax error during RUN. In this case, nothing will be written to the CPU and operation will continue.

| Error code | Name | $\begin{aligned} & \text { Opera- } \\ & \text { tion } \\ & \text { status } \end{aligned}$ | Description and steps to take | $\begin{gathered} \text { © } \\ \text { ì } \end{gathered}$ | 은 | $\begin{aligned} & \text { 믕 } \\ & \text { 민 } \end{aligned}$ | $\begin{aligned} & \text { W } \\ & \text { 묘 } \end{aligned}$ | $\begin{aligned} & \times \\ & \text { ㄴ́ㄴ } \end{aligned}$ | N | T | 工 S - 는 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| E6 | Compile memory full error | Stops | The program is too large to compile in the program memory. <br> $\Rightarrow$ Change to PROG. mode and reduce the total number of steps for the program. -FP10SH <br> If memory expansion is possible,compilation will become possible when the memory is expanded. | A | A | A | A | A |  | A | A |
| E7 | High-level instruction type error | Stops | In the program, high-level instructions, which execute in every scan and at the leading edge of the trigger, are programmed to be triggered by one contact. (e.g. FO (MV) and PO (PMV) are programmed using the same trigger continuously.) <br> $\Rightarrow$ Correct the program so that the high-level instructions executed in every scan and only at the leading edge are triggered separately. |  |  | A | A | A | A | A | A |
| E8 | High-level instruction operand combination error | Stops | There is an incorrect operand in an instruction which requires a specific combination operands (for example, the operands must all be of a certain type). <br> $\Rightarrow$ Enter the correct combination of operands. | A | A | A | A | A | A | A | A |
| E9 | No program error | Stops | Program may be damaged. <br> $\Rightarrow$ Try to send the program again. |  |  |  |  |  |  | A | A |
| E10 | Rewrite <br> during <br> RUN <br> syntax error | Continues | When inputting with the programming tool software, a delection, addition or change of order of an instruction(ED,LBL,SUB,RET,INT,IRET,SSTP , and STPE) that cannot perform a rewrite during RUN is being attempted. Nothing is written to the CPU. |  |  |  |  |  | A | A | A |

Table of Self-Diagnostic Error

*1) This error occurs on FP-X Ver2.0 or later.
A:Available

| Error code | Name | Operation status | Description and steps to take | $\begin{aligned} & \text { M } \\ & \text { ì } \end{aligned}$ | 은 | $\begin{aligned} & \text { 믕 } \\ & \text { 민 } \end{aligned}$ | $\begin{aligned} & \text { W } \\ & \text { 㽞 } \end{aligned}$ | $\begin{aligned} & \times \\ & \text { 신 } \end{aligned}$ | ~ | T | エ O त त |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| E29 | Configuration parameter error | Stops | A parameter error was detected in the MEWNET-W2 configuration area. Set a correct parameter. |  |  |  |  |  | A | A |  |
| E30 | Interrupt error 0 | Stops | Probably a hardware abnormality. <br> $\Rightarrow$ Please contact your dealer. |  |  |  |  |  |  |  |  |
| E31 | Interrupt error 1 | Stops | An interrupt occurred without an interrupt request. A hardware problem or error due to noise is possible. <br> $\Rightarrow$ Turn off the power and check the noise conditions. | A | A | A | A | A | A | A | A |
| E32 | Interrupt error 2 | Stops | There is no interrupt program for an interrupt which occurred. <br> $\Rightarrow$ Check the number of the interrupt program and change it to agree with the interrrupt request. | A | A | A | A | A | A | A | A |
| E33 | Multi-CPU <br> data <br> unmatch error | CPU2 <br> Stops | This error occurs when a FP3/FP10SH is used as CPU2 for a multi-CPU system. $\Rightarrow$ Refer to "Multi-CPU system Manual". |  |  |  |  |  |  | A | A |
| E34 | I/O status error | Stops | An abnormal unit is installed. <br> -FP $\Sigma$, FPOR(FPOR mode),FP-X, FP2,FP2SH and FP10SH: <br> Check the contents of special data register DT90036 and locate the abnormal unit.Then turn off the power and replace the unit with a new one. <br> -FP3: <br> Check the contents of special data register DT9036 and locate the abnormal unit. Then turn off the power and replace the unit with a new one. |  |  | A | A | A |  | A | A |
| E35 | MEWNET-F <br> slave <br> illegal unit error | Stops | A unit, which cannot be installed on the slave station of the MEWNET-F link system, is installed on the slave station. <br> $\Rightarrow$ Remove the illegal unit from the slave station. |  |  |  |  |  | A | A | A |
| E36 | MEWNET-F <br> (remore <br> I/O) <br> limitation error | Stops | The number of slots or I/O points used for MEWNET-F(remote I/O) system exceeds the limitation. <br> $\Rightarrow \operatorname{Re}$-configure the system so that the number of slots and I/O points is within the specified range. |  |  |  |  |  | A | A | A |
| E37 | MEWNET-F <br> I/O <br> mapping error | Stops | I/O overlap or I/O setting that is over the range is detected in the allocated I/O and MEWNET-F I/O map. <br> $\Rightarrow$ Re-configure the I/O map correctly |  |  |  |  |  | A | A | A |

| Error code | Name | Opera－ tion status | Description and steps to take | $\begin{aligned} & \text { せ1 } \\ & \text { iL } \end{aligned}$ | 은 | $\begin{array}{\|l} \text { 뜽 } \\ \text { 문 } \end{array}$ | $\begin{aligned} & \text { W } \\ & \text { 㽞 } \end{aligned}$ | $\begin{aligned} & \times \\ & \text { ㄴㄴㄴ } \end{aligned}$ | N | 工 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| E38 | MEWNET－F <br> slave I／O <br> terminal <br> mapping error | Stops | I／O mapping for remote I／O terminal boards，remote I／O terminal units and I／O link is not correct． <br> $\Rightarrow \mathrm{Re}$－configure the I／O map for slave stations according to the I／O points of the slave stations． |  |  |  |  |  | A | A | A |
| E39 | IC card read error | Stops | When reading in the program from the IC memory card（due to automatic reading because of the dip switch setting or program switching due to F14（PGRD）instruction）： <br> －IC memory card is not installed． <br> －There is no program file or it is damaged． <br> －Writing is disabled． <br> －There is an abnormality in the AUTOEXEC．SPG file． <br> －Program size stored on the card is larger than the capacity of the CPU． <br> $\Rightarrow$ Install an IC memory card that has the program proterly recorded and execute the read once again． |  |  |  |  |  |  | A | A |
| E40 | I／O error | Sele－ ctable | Abnormal I／O unit． <br> FP $\Sigma$ ，FP－X： <br> Check the contents of special data register DT90002 and abnormal FP $\Sigma$ expansion unit （application cassette for FP－X）．Then check the unit． <br> FP2 and FP2SH： <br> Check the contents of special data registers <br> DT90002，DT90003 and abnormal I／O <br> unit．Then check the unit． <br> Selection of operation status using system register21： <br> －to continue operation，set 1 <br> －to stop operation，set 0 <br> Verification is possible in FPWIN GR／Pro at＂I／O error＂in the status display function． <br> MEWNET－TR communication error FP3 and FP10SH： <br> Check the contents of special data registers（FP3：DT9002，DT9003，FP10SH：DT9 0002，DT90003）and the erroneous master unit and abnormal I／O unit．Then check the unit． <br> Selection of operation status using system register21： <br> －to continue operation，set 1 <br> －to stop operation，set 0 <br> Verification is possible in FPWIN GR／Pro <br> at＂I／O error＂in the status display function． |  |  |  | A | A | A | A | A |

Table of MEWTOCOL-COM Communication Error

| Error <br> code | Name |  |
| :--- | :--- | :--- |
| $!21$ | NACK error | Link system error |
| $!22$ | WACK error | Link system error |
| $!23$ | Unit No. overlap | Link system error |
| $!24$ | Transmission format <br> error | Link system error |
| $!25$ | Link unit hardware <br> error | Link system error |
| $!26$ | Unit No. setting error | Link system error |
| $!27$ | No support error | Link system error |
| $!28$ | No response error | Link system error |
| $!29$ | Buffer closed error | Link system error |
| $!30$ | Time-out error | Link system error |
| $!32$ | Transmission <br> impossible error | Link system error |
| $!33$ | Communication stop | Link system error |
| $!36$ | No destination error | Link system error |
| $!38$ | Other communication <br> error | Link system error |
| $!40$ | BCC error | A transfer error occurred in the received data. |
| $!41$ | Format error | A command was received that does not fit the format. |
| $!42$ | No support error | A command was received that is not supported. |
| $!43$ | Multiple frames <br> procedure error | A different command was received when processing multiple <br> frames. |
| $!50$ | Link setting error | A route number that does not exist was spacified. Verify the <br> route number by designating the transmission station. |
| $!51$ | Transmission <br> time-out error | Transmission to anather device not possible because <br> transmissition buffer is congested. |
| $!52$ | Transmit disable <br> error | Transmission processing to another device is not possible.(Link <br> unit runaway,etc.) |
| $!53$ | Busy error | Command process cannot be received because of multiple <br> frame processing.Or,cannot be received because command <br> being processed is congested. |
| $!60$ | Parameter error | Content of spacified parameter does not exist or cannot be used. |
| $!61$ | Data error | There was a mistake in the contact,data area,data number <br> desigination,size designation,range,or format designation. |
| $!62$ | Registration over <br> error | Operation was does when number of registrations was exceeded <br> or when there was no registration. |
| $!63$ | PC mode error | PC command that cannot be processed was executed during <br> RUN mode. |
|  |  |  |
|  |  |  |

| Error <br> code | Name |  |
| :--- | :--- | :--- |
| $\mathbf{6 4}$ | External memory <br> error | An abnormality occurred when loading RAM to ROM/IC memory <br> card.There may be a problem with the ROM or IC memory card. <br> --When loading,the specified contents exceeded the capacity. <br> -Write error occurs. <br> -ROM or IC memory card is not installed. <br> -ROM or IC memory card does not conform to specifications <br> -ROM or IC memory card board is not installed. |
| $!65$ | Protect error | A program or system register write operation was executed when <br> theb protect mode (password setting or DIP switch,etc.)or ROM <br> operation mode was being used. |
| $!66$ | Address error | There was an error in the code format of the address data. <br> Alsi.when exceeded or insufficient of address data,there was a <br> mistake in the range designation. |
| $!67$ | No program error <br> and No data error | Cannot be read because there is no program in the program <br> area or the memory contains an error.Or,reading was attempted <br> of data that was not registered. |
| $!68$ | Rewrite during RUN <br> error | When inputting with programming tool software,editing of an <br> instruction (ED,SUB,RET,INT,IRET,SSTP,and STPE) that <br> lannot perform a rewrite during RUN is being attempted. <br> Nothing is written to the CPU. |
| $\mathbf{7 0}$ | SIM over error | Program area was exceeded during a program write process. |
| $\mathbf{7 7 1}$ | Exclusive access <br> control error | A command that cannot be processed was executed at the same <br> time as a command being processed. |

### 14.5 MEWTOCOL-COM Communication Commands

Table of MEWTOCOL-COM commands

| Command name | Code | Description |
| :--- | :--- | :--- |
|  | RC |  |
| (RCS) |  |  |
| Read contact area | Reads the on and off status of contact. <br> (RCC) | - Specifies only one point. <br> - Specifies multiple contacts. <br> - Specifies a range in word units. |
| Write contact area | WC <br> (WCS) <br> (WCP) <br> (WC) | Turns contacts on and off. <br> - Specifies only one point. <br> - Specifies multiple contacts. <br> - Specifies a range in word units. |
| Read data area | RD | Reads the contents of a data area. |
| Write data area | WD | Writes data to a data area. |
| Read timer/counter set value area | RS | Reads the value set for a timer/counter. |
| Write timer/counter set value area | WS | Writes a timer/counter setting value. |
| Read timer/counter ellapsed value area | RK | Reads the timer/counter elapsed value. |
| Write timer/counter elapsed value area | WK | Writes the timer/counter elapsed value. |
| Register or Reset contacts monitored | MC | Registers the contact to be monitored. |
| Register or Reset data monitored | MD | Registers the data to be monitored. |
| Monitoring start | MG | Monitors a registered contact or data using the <br> code "MC or MD". |
| Preset contact area (fill command) | SC | Embeds the areaof a specified range in a 16- <br> point on and off pattern. |
| Preset data area (fill command) | SD | Writes the same contents to the data area of a <br> specified range. |
| Read system register | RR | Reads the contents of a system register. |
| Write system register | WR | Specifies the contents of a system register. |
| Read the status of PLC | RT | Reads the specifications of the programmable <br> controller and error codes if an error occurs. |
| Remote control | RM | Switches the operation mode of the <br> programmable controller. |
| Abort | AB | Aborts communication. |

### 14.7 ASCII Codes

## Record of changes

| Manual No. | Date | Description of changes |
| :---: | :---: | :---: |
| ACG-M0084-1 | JAN. 1997 | First edition |
| ACG-M0084-2 | JUL. 1997 | 2nd edition <br> - Size change (from A5 to B5) <br> - Newly addition of FPO transistor output type information |
| ACG-M0084-3 | JUN. 1998 | 3rd edition <br> - Descriptions for FPO control units with RS232C port are added. <br> - Descriptions for FPO input only and output only type expansion units are added. <br> - Descriptions for FPO analog I/O unit is added. |
| ARCT1F389E | FEB. 2004 | 4th edition <br> - Addition Programming Manual Chapter 4 <br> (ACG-M0084-3) Chapter 5 <br> Chapter 6 <br> Chapter 8 <br> S-LINK Control unit ARCT1F263E <br> - Delete <br> Chapter 8 Connecting the I.O.P. Display Panel Chapter 9 Trial Operation |
| ARCT1F389E-1 | FEB. 2006 | 5th edition |
| ARCT1F389E-2 | JUN. 2007 | 6th edition |
| ARCT1F389E-3 | FEB. 2009 | 7th edition <br> - Change in Corporate name |
| ARCT1F389E-4 | JUN. 2010 | 8th edition |
| ARCT1F389E-5 | AUG. 2011 | 9th edition <br> - Change in Corporate name <br> - Fixed Errors |
